In order to decrease the number of accidents materially, two factors must be taken into account. The first is that some accidents, or classes of accidents, could have been prevented by the simple exercise of judgment on the part of men who can reason. The other factor is the less patent one, as it has to do with happenings which cannot be foreseen. Thus, a wreck may occur on a railroad either as the result of an open switch or a broken rail. The first case falls within the range of readily preventable accidents, as the man throwing the switch should have reasoned properly. The latter case, however, could not have been foreseen ordinarily as things go. It may be stated that for every one accident of the latter class, there are many of the first which are readily preventable.

Even the development of the multitude of safety devices, though doing much good along correct lines, has not reduced the accident percentages to any very notable extent, simply because the personal factor—the continually anticipating what would happen if certain conditions prevailed—has not been emphasized properly. It seems unfortunate that our social and business fabric is such that credit is given the man who cures rather than the man who prevents accidents to life and damage to property. Nevertheless this should not deter us from doing our manifest duty as citizens and men in removing every factor that may lead to injury to or actual loss of life and property.

The Supervisor's Part.

In the nature of things, it is the supervisor of things and men, or the manager of works, who should anticipate possible injury by providing guards of the right kind. He who is deficient in this will soon become obsolete in industrial life. There need only be called to mind the many accident compensation laws passed by the different states between 1911 and 1913. The day has passed when a person may be maimed and receive nothing in the way of compensation. It would need only a few accidents of the very highly paid kind to effectually put a firm out of business, even if covered by insurance, unless the resources were ample.

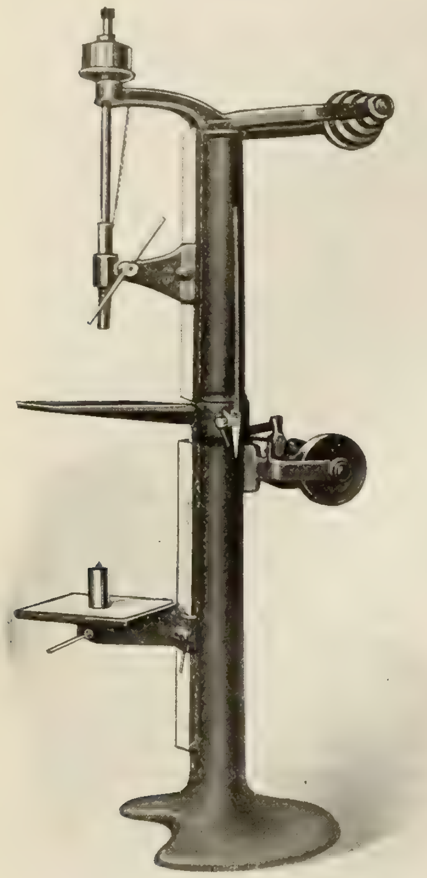
It is an idea of the author's, and which he has used in a limited way, that the supervisors of a plant should regularly make it a habit to jot down in a memorandum book any matter arising which might have led to an accident, and how this can be forestalled the next time. He has found this to work admirably, while the cost is trifling, and need not be more than half a dollar a year per man acting as foreman, superintendent or manager. Either let the memoranda be jotted down during the day, or at home in the evening in thinking matters over. Doing this soon becomes a habit, and finally a satisfaction. If one can think "Well, I saved that poor fellow's finger to-day," or maybe his leg or life, or prevented a mistake which would have cost heaps of money, there must be a genuine gratification.

While the keeping of such a memorandum book of risks annulled might be overdone by someone using it as a means of advancement for himself, yet employers of labor should foster the idea, and by showing a substantial appreciation, gradually encourage every one interested to do the same and thus enormously reduce accidents. Prevention is always better than cure.

---

*From a paper read before the recent Foundrymen's Convention in Chicago.

It would indeed be well if regular blank forms were given to the supervisors of a plant with this purpose in view, as from the record of what occurred and what might have resulted therefrom will be learned the advisable safety devices a plant stands in need of specially. Moreover, this can be extended to include accidents which might have been injurious to the property itself, and even the business.



SENSITIVE COLUMN DRILL T.2.

He who has never given a thought to these things, on trying this memorandum record method, will be soon surprised to learn how much can be accomplished by it. He will soon see how many accidents and how much damage he can forestall in making his daily rounds about the shop and among the machinery. There will be many, of course, who will try this method and not find it help them much. This is a matter of individual disposition, and hence the system should not be condemned for failure when the real difficulty lies in the man who uses it.

Accident Liability.

The recent expansion of accident liability is quickly increasing the rating of those works in which the hazards are extra large on account of the indifference of the supervisors. It will eventually cause the rejection of many of them, or at least limit the compensation. It is quite evident that the original plan that every line of business shall have a rating to cover all chances of accident within it will not hold. It will happen that individual concerns will find their premiums advanced beyond others, even if in the same line of work, according to their prevalence of accidents and their character. The ultimate effect will be bankruptcy.

State liability laws are being closely watched as to their effect, and some results have come that have not been anticipated, to the discouragement of those who are anxiously seeking proper protection while desiring justice for their employes. There is a general interest displayed, and the hope seems to prevail that everything will work out right and equitably.

Everything possible should be done by an establishment to keep its supervisors alive to the importance to preventing chances for accident, to adopt accident prevention and safety devices wherever possible, but not to depend upon these devices to the exclusion of the eternal vigilance required from every individual connected with the plant, to consider "safety first." It is admitted that all this makes an extra load to carry, but humanity alone would require it, if indeed the selfish side of it did not make it obligatory at the present time.

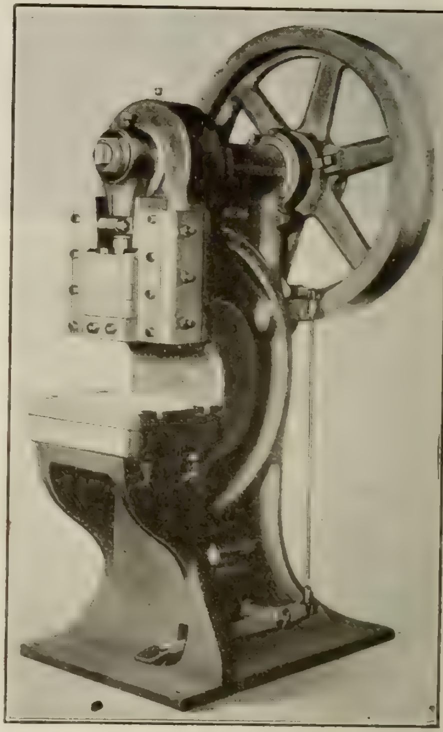
SENSITIVE COLUMN DRILLS.

THE data and illustration refer to the Sensitive Column Drills built by the Hamilton Tool Co., Hamilton, Ont. They are high grade tools designed for accurate and rapid drilling, being capable of producing ½ inch holes, and drilling to centre of a 14 inch circle. The spindle, made from high-grade stock, is carefully fitted and bores to No. 1 Morse Taper. It is driven by 1½ inch flat belt, has three speeds, cut steel rack and pinion feed, and an adjustable stop to gauge depth of holes. It is entirely relieved of belt strain and is counterbalanced by a weight inside of the column, which makes it sensitive to the touch. It has ball bearing thrust and is provided with means for taking up wear and lost motion. The spindle-head is adjustable on slides.

With the machine T.I., one table only is pitted, while on machine T.2., there are two tables, it will be noted from the cut. In the latter case, when the lower table is in service, the upper can be swung around the column out of the way. In both types, the lower table moves the entire length of the column, and the combination centre fits in bracket of this or the only table as the case may be. The countershaft is attached to the machine, and the belt shifter is conveniently arranged, having two handles for manipulation from either side. These drills can be placed under the line shaft, thus avoiding the trouble and expense of putting up a countershaft. The weight of each machine is 300 pounds.

POWER PUNCHING PRESS.

A NEW power punching press is here shown, which combines several features not previously brought together in this type of press. The face of the frame across the gibs is very broad, permitting V-gibe and a large area on bottom of the slide for the support of the upper die or punch. The connection is a steel casting with bronze bushing. The diameter and length of pin bearing is much larger than where the eccentric adjustment is employed, and the adjustment of slide is also considerably in excess of what can conveniently be obtained with an eccentric bushing, besides, the adjustment will not slip or change under any load. Two clutch pins are regularly furnished in the fly wheel, so that the clutch will engage every half revolution.



POWER PUNCHING PRESS.

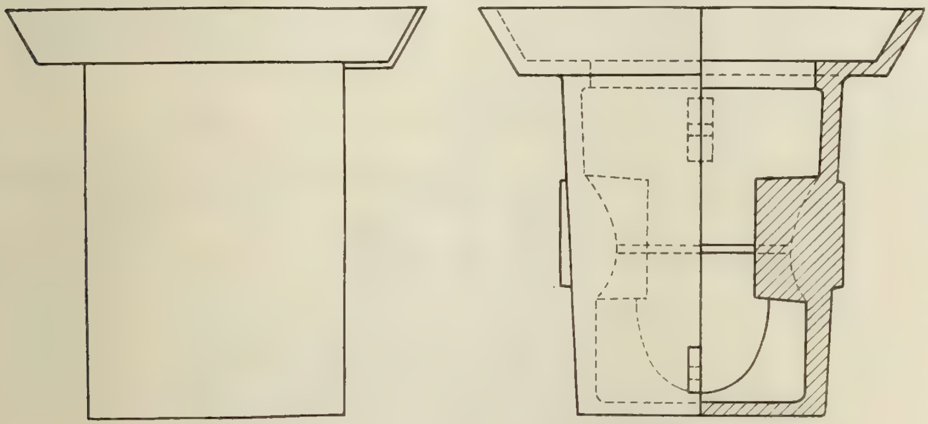
These presses, which are manufactured by the Cleveland Machine & Mfg. Co., Cleveland, Ohio, are built in seven sizes, either plain or geared, and are especially adapted for use in the manufacture of hardware, locks, cutlery, typewriters, automobile parts, and trimming drop forgings.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

PISTON PATTERNS AND COREBOXES.

IN casting pistons for gasoline engines one of the most satisfactory methods of making the patterns is shown in the accompanying cut. The pattern is solid with an enlarged print to the upper end, and the latter should extend out from one to two inches depending upon the size of the piston. The angle of the print at the sides should be about 30 degrees. Many firms make the cores in two parts, and then paste them together. This method, however, does not produce a true core, as when they are rubbed down and afterwards pasted, it is impossible to get the two halves exactly alike, and there is usually quite a fin cast in the middle of the finished piston.



PATTERN

COREBOX.

PISTON PATTERNS AND COREBOXES.

In the case illustrated a cast-iron corebox is used, being made in two halves. The halves of the box are cast without bosses or ribs on the inside, the edges being then disc ground or planed and afterwards clamped together and dowell pins inserted on either side. While thus clamped, the core box is turned completely out on the inside to the proper dimensions depending upon the piston, the upper part, of course, fitting the print on the pattern. The bosses and ribs are next inserted in the two halves and held by riveting. The inside of the box should be given two or three coats of shellac in which soap-stone has been mixed, sanding each coat down lightly before applying the next. This will give a finish that does not hold the sand and is very lasting; the soap-stone also fills any of the pores or cracks in the metal.

In using the box, the two halves are clamped together by means of a C-clamp, and the core rammed up. One of the best core plates for this kind of a core is a stove lid, being just about the right size for the ordinary piston core. Upon inverting and unclamping, the two halves of the box are readily drawn off to the side, and if carefully done there is not even a seam to be detected along the side of the core.

Some foundries do not use a cope on their piston molds when the pistons are made in this manner. About four pistons are usually cast in a flask with a common pouring gate and weights set on the cores. One of the best methods, however, is to have individual cast iron flasks of the proper size for each piston. The advantage is that these can be readily rammed up on the bench, using the minimum amount of sand, and being easily handled. Should it be desired to use a cope, one can be rammed up on a flat board. The metal is poured alongside the tapered print as shown on the pattern. In many foundries, this method is also used for cylinder heads as well as for small engine bases. While the core work is increased slightly, yet a resultant saving is obtained on the whole as well as better castings.—D. O. Barrett.

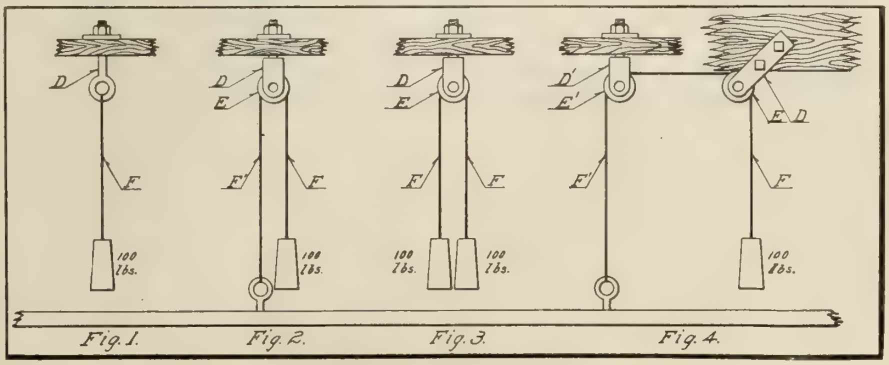
* * *

COUNTERBALANCING DEVICE.

THE sketch Fig. 5 shows an arrangement to counterbalance the overhanging weight of a heavy casting, while being milled on a small vertical milling machine. Several problems presented themselves which gave rise to considerable discussion among the men in the shop. These pertained to the strain upon the different sections of the rope, and also to the pull upon the hangers (D) and (D^1) when the weights were supported in different ways.

The operations upon the casting (A) were such that considerably over half of it would extend over the edge of the circular table (B). The auxiliary plate or table (C) was used to support the casting, which weighed about 300 lbs. When the work was secured in position, undue strain was placed upon the revolving table (B), and to overcome this, the hangers (D) and (D^1) with shafts and rollers (E), (E^1) were secured to the overhead joists, in such a position that the drops of the rope (F) and (F^1) came in the position shown, one in front and the other at the back of the machine. The weight (G) was arranged to balance the overhang of the work (A). The main interest in the foregoing is hinged upon the strain on the rope, due to the hanging weight.

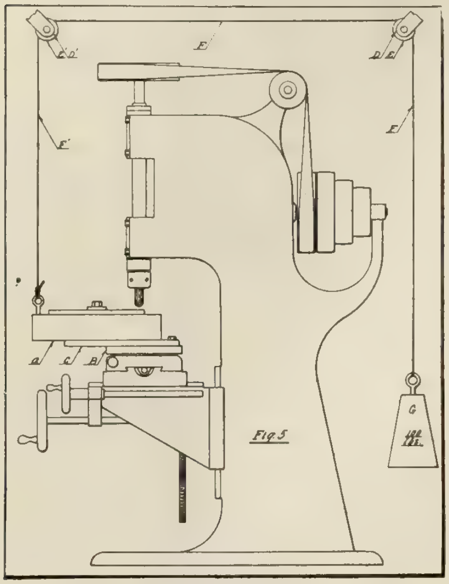
Fig. 1 shows a weight of 100 lbs. hanging on a rope (F) from an eye-bolt (D), secured to the floor above. It appears quite clear that there is a pull of 100 lbs. on the rope, and also on the eye-bolts. In Fig. 2, the rope passes freely over a pulley in the fork-bolt (D). A weight of 100 lbs. hangs on one end



COUNTERBALANCING DEVICE.

(F) of the rope, and the other end (F^1) is secured to an eye-bolt in the floor. Just here the difference of opinion arose. In my estimation, there is a pull or tension of 100 lbs. throughout the full length of the rope, but a pull of 200 lbs. on the fork-bolt (D). In Fig. 3, the results are the same, the hanging weight taking the place of the eye-bolt in the floor. Fig. 4 shows the arrangement of the rope and pulleys as illustrated in the sketch Fig. 5.

While my opinion is that there is a pull or tension of 100 lbs. throughout the entire length of the rope, others contended that the tension on the horizontal section of the rope between the two pulleys (E) and (E^1) was greater, or the equivalent of the pull on (F) plus the pull on (F^1). This difference of opinion was also in evidence regarding Fig. 2 and 3.



COUNTERBALANCING DEVICE.

Another problem that came under discussion was the arrangement of the hangers (D) and (D^1) on the joists. As the pull, in my opinion, is equal horizontally and vertically, the hangers should be in the position (D), Fig. 4, or at an angle of 45 degrees. Opinions of readers would be much appreciated.—J. H. R.

⁂

THE UTILIZATION OF A BY-PRODUCT—EXHAUST STEAM.

AT this time when increased efficiency and reduction of power costs are vital considerations in connection with the operation of manufacturing plants, it might be well to call to mind in a general way some of the many methods for effecting appreciable economies by the utilization of the exhaust steam which is usually available as a by-product. This whole matter assumes greater significance when it is remembered that from 80 per cent. to 90 per cent. of the heat imparted to the feed water in the boiler is present in the exhaust steam after passing through the engine cylinder. The foregoing statement may be checked up by assuming a typical case.

Typical Case.

Take, for example, a medium-sized plant, using automatic non-condensing engines, which consume, say, 25 pounds of steam per i.h.p. at 100 lbs. gauge pressure. Reference to a steam table will show that 1,157 heat units must be added in the boiler to the feed water at 60 deg. to produce one pound of steam at the pressure named. Hence, 25 lbs. of steam will require the addition of 28,925 heat units. When the steam is admitted to the engine, it is (1) turned into useful work; (2) dissipated through radiation losses, drips, etc.; or (3) swept out with the exhaust steam.

The heat involved in the first operation may be easily calculated; the losses experienced in the second operation can be closely estimated; while the difference between the sum of the heat consumed in these two operations and the total heat carried in the steam will, of course, represent the heat available in the exhaust. The first calculation may be made as follows:

Since one heat unit equals 778 foot pounds of work, by dividing this 778 ft. lbs. into 33,000 ft. lbs. per min. per h.p., we get 42 heat units required per h.p. per minute. Multiplying this 42 heat units by 60 minutes, we get 2,520 heat units per hour consumed in developing one horse-power of work in the engine. Radiation losses may be estimated conservatively at from 5 to 10 per cent. of the total heat of the steam, and adding this radiation loss to the heat consumed in the engine, we find that but 16 to 19 per cent. of the heat developed in the boiler to produce one h.p. of steam, or 28,925 heat units, has been expended in passing through the engine. It is, therefore, apparent that approximately 80 per cent. to 85 per cent. of the heat developed in the boilers at the expense of coal and labor is available for use in many plants in the form of exhaust steam. With these figures in mind there can be no doubt as to the advisability, or, in fact, the necessity of utilizing this exhaust steam, and the question resolves itself into securing the most efficient and economical conservation of this heat.

Before considering, however, the various methods for utilizing this exhaust steam, it is essential that mention be made of means for ridding it of what has in the past proved to be the greatest obstacle against its general use—that is, the elimination of lubricating oil carried in the steam during its passage through the engine cylinders. If this oil is allowed to remain in the steam, even when it does not come into actual contact with the substance being heated, as, for instance, in heating coils, closed or tubular heaters, etc., the accumulation of grease on the heating surfaces greatly reduces the heat transferring efficiency of same. The presence of oil also renders the condensation from such coils unfit for use unless purified of the oily emulsion. In localities where water is of poor quality, or is expensive, the loss of this otherwise pure condensation is quite serious, especially when it is considered that the drips from a 100 h.p. closed heater will amount in a ten-hour run to approximately four to five thousand pounds of pure water. Where the exhaust steam is brought into direct contact with the substances being heated, such as in heating feed water in open heaters, it is absolutely necessary that this steam be free from oil contamination.—Wilbert Sailer.

⁂

BRONZE PLATING SOLUTIONS CONTAINING TIN.

A TRUE bronze consists of copper and tin, and one would naturally think that these two metals should be used in making up a bronze plating solution. This idea, however, is wrong, and it is rare indeed to find a plater who has ever used tin in a bronze solution. The necessary bronze color can be obtained by the use of copper and zinc, and it is these two metals that are so extensively used in bronze plating. The objections to the use of tin in making up a bronze plating solution are as follows:—

1.—The solution containing tin is more difficult to maintain than one containing zinc.

2.—Tin is far more costly than zinc.

3.—As far as known, it is very difficult to obtain as good a bronze color with the tin, although theoretically it should present no difficulties. The color usually obtained by the use of tin is not as good a bronze color as it is when zinc is used.

The difficulty of obtaining a bronze color is singular for the reason that the alloy of the two metals is the true bronze color. Those who desire to try the tin, can dissolve some tin salts in cyanide and add to a good cyanide copper solution until it plates a bronze. As there is no objection to the use of zinc in a bronze solution and it is cheap, the employment of tin is not required.—Brass World.

DEVELOPMENTS IN MACHINERY

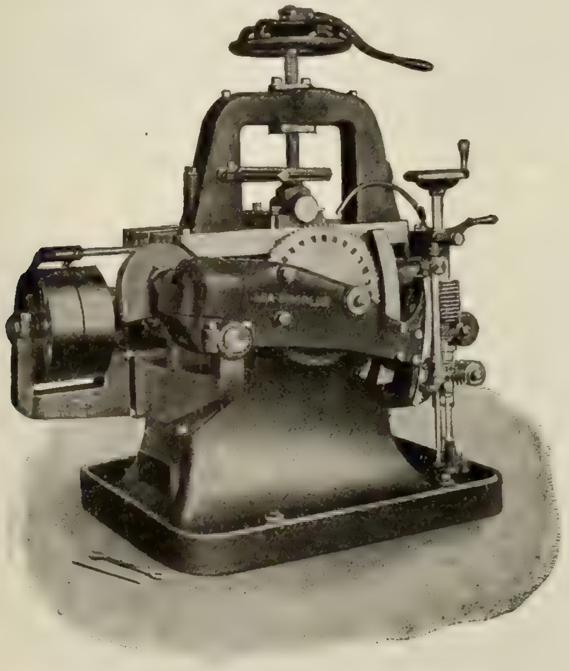
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

LEA-SIMPLEX COLD METAL SAW.

THE following are among the outstanding features of what is commercially known as the No. 15 Lea-Simplex Cold Metal Saw, built by the Lea Equipment. Co., Philadelphia, Pa.

The frame is cast in one piece and heavily ribbed to procure rigidity. It is provided with three bearings to carry the main drive shaft and the trunnions of the swing arm. All bearings are of liberal proportions and provided with bushings.

The top of the frame serves as work table. It has three T. Slots and a number of pin holes for the fastening and setting of the clamping blocks or of the stock itself, such as structural shapes, etc. The rear edge of the work table is protected with a wearing strip of steel.



LEA-SIMPLEX COLD CUTTING-OFF SAW.

The bottom of the frame casting is designed to serve as a receptacle or tank for the cutting compound. At one side of the frame a pad is provided to which a motor support can be bolted in case the saw is to be driven by a motor and which replaces the bracket carrying tight and loose pulleys required for belt drive. The pulleys are placed below the surface of the work table, which allows the unrestricted use of the whole table, an advantage especially appreciated when long stock is to be sawed off at an angle.

The swing arm consists of a strong and rigid casting suspended at three points only. This three-point suspension relieves the bearings of side thrust. The swing arm carries at one end two trunnions which rest in bearings forming part of the frame. Its other end is supported at one point only through the teeth of an accurately cut quadrant which engages a worm that raises and lowers the swing arm. This worm when raising the arm advances the blade with an absolutely uniform motion.

The saw arbor bearing is bushed and extra long to obtain rigidity. Removable plates are fastened to the side arm to guide the blade and prevent loss of alignment. These guides are made of tool steel and ground to a perfect fit, and their temper is drawn sufficiently to prevent injury to the blade. An improved device permits ready adjustment for wear. Inside the swing arm casting the spindle is located which drives the blade.

The drive consists of a sprocket which engages with radial slots in the blade, the sprocket being fastened to the end of a spindle made of crucible steel. It runs in bronze bearings. A bevel gear is mounted on the other end, through which the blade is driven from the main drive shaft. The sprocket has a tapered bore to fit the conical end of the spindle, and is keyed in place and clamped with nut and washer. Both spindle and sprocket are ground to insure perfect contact and interchangeability. Guide plates protect the blade from side thrust and buckling at the point where the power is transmitted from the sprocket.

The sprocket is made of special chrome nickel-steel, which, after treatment, has a tensile strength of about 250,000 lbs. and an elastic limit of 225,000 lbs. per square inch. The sprocket teeth are planed to a form which gives best wearing qualities, and the sprockets when finished are treated and hardened to insure uniform hardness and long life.

The blade is of either 15 in., 18 in., 21 in. or 24 in. diameter, according to the size of the machine, and 5-32 in. to 3-16 in. thick. The arbor hole is 1¼ in. or 1½ in. in diameter, while the saw teeth have a pitch from ¼ in. to ⅞ in. Standard blades are furnished in high carbon crucible steel, special blades in vanadium steel or high speed steel, and have every other tooth beveled to prevent the chips from freezing to the blade.

The lubricant is contained in a tank, which forms part of the base of the machine. It is large enough, not only to give the pump an ample supply to draw from, but also to prevent loss and waste from spilling or splashing over if a piece of material cut off should accidentally drop into it. A rotary pump, driven through gears from the feed shaft is located in the tank at the front of the machine. It is of substantial construction, and operates indefinitely without attention. A system of pipes carries the lubricant to the cutting edge of the blade. The nozzle, on the end of a flexible tube, can be adjusted to deliver the lubricant at the proper point of the blade.

The feed mechanism consists of a vertical feed shaft carrying a large worm and two spiral gears with necessary clutch for feed and return and of a control rod operating the clutch. The worm engages the quadrant fastened to the swing arm, moving it up or down, thus feeding the saw blade or returning it. The worm is driven in one direction or the other according to the position of the clutch, engaging either the lower gears for the feed or the upper set for the return. The feed shaft has two babbitted guide bearings on top and bottom and rests on a roller thrust bearing. The control rod is moved up or down manually by a lever which throws handle on its upper end or automatically by an adjustable dog and tripping device. It also carries a lever to throw the clutch. By moving the handle into the proper position, the blade is either fed upward, downward or not fed at all. The automatic control is operated through a lug on the swing arm casting when it comes into contact with an adjustable dog on the control rod. The position of the dog is adjusted to suit the length of feed necessary to complete the cut of the work in hand. When lug and dog come in contact, a tripping device located at the bottom of the control rod is released, which, at the will of the operator, either returns the blade automatically or throws the feed out altogether. The return is geared in such a ratio that it is very rapid, thus adding another time-saving feature.

The feed is regulated by means of the well-known Sellers disc principle; the whole mechanism being contained in a separate box at the front of the machine, close to the operator. The mechanism consists of a lower and an upper shaft controlling the feed and the return respectively, and of a set of friction discs with indicator. The power required to feed the saw blade is transmitted from the main drive shaft to the upper shaft by sprockets and a heavy roller chain, which latter is located under the work table. It then passes from the upper shaft to the lower shaft through four friction discs. Feed regulation is obtained by changing the relative position of these discs to each other. This is accomplished by turning the ball crank on the top of the box. The exact feed per minute with which the blade is cutting is shown by a graduated indicator rod, in plain sight of the operator on the top of the box. The knob on the end of the horizontal shaft permits to regulate the friction between the discs to obtain a positive feed as required by the hardness of the stock to be cut. If at any time the cutting resistance becomes too heavy for the feed, then the friction discs will slip, and the blade will not be fed further. The feed box is so constructed that cutting compound, even if it should leak in, cannot affect its operation. All shafts run in brass bushed bearings and every part is easily accessible for lubrication.

The yoke and clamping mechanism consists of a heavy iron casting, a clamping screw and suitable blocks fastened to the table. The yoke is provided with a large slot which permits shifting of the screw parallel with the blade, to quickly adjust the stock to the blade. The screw carries on the top a hand-wheel with detachable lever for quick operation, and the upper clamp block at its lower end.

The latter, made of steel, is fastened to the screw and can be swiveled at any angle. It has a 120 degree crotch for holding large stock and a 90 degree crotch for small stock. The lower clamp blocks consist of two separate castings, the sides of which have such shape that by reversing them either square or round stock can be securely held. By making these lower clamp blocks separate they can be placed in any position on the work table, and by making them in two parts the stock can be brought very close to the table.

An adjustable gauge is attached to the yoke casting. It consists of a rod carrying a cast iron arm. By moving this arm into the desired position and clamping it in place with a thumb screw, any number of pieces of equal length can be sawed off without further measuring. It is only necessary to advance the stock as far as the arm will allow.

Belt-driven machines are furnished with tight and loose pulleys and are driven direct from the line shaft. No countershaft is required. A belt shifter is provided, and arranged in such a manner that its handle is conveniently located at the front of the machine, close to all other operating handles. The operator never has to leave his position to start or stop the saw.

Saws are often installed in such places that it is impossible to drive them from a line shaft. In such cases they must be equipped with a motor drive. All Lea Simplex saws are provided with planed pads to which a motor support can be bolted, if it is required at any future time. In order to change the machine from belt to motor drive, it is only necessary to procure the support, motor and transmission, which may be either a set of gears or sprockets with silent chain. The chain drive is strongly recommended in preference to gearing, as it is practically noiseless and will give long service. If the machine is to be used not only for sawing of hard tool steel, but also for cutting of soft structural shapes, then a motor-driven machine should be used, because a variable speed motor will give the most economical speeds for each kind of material.

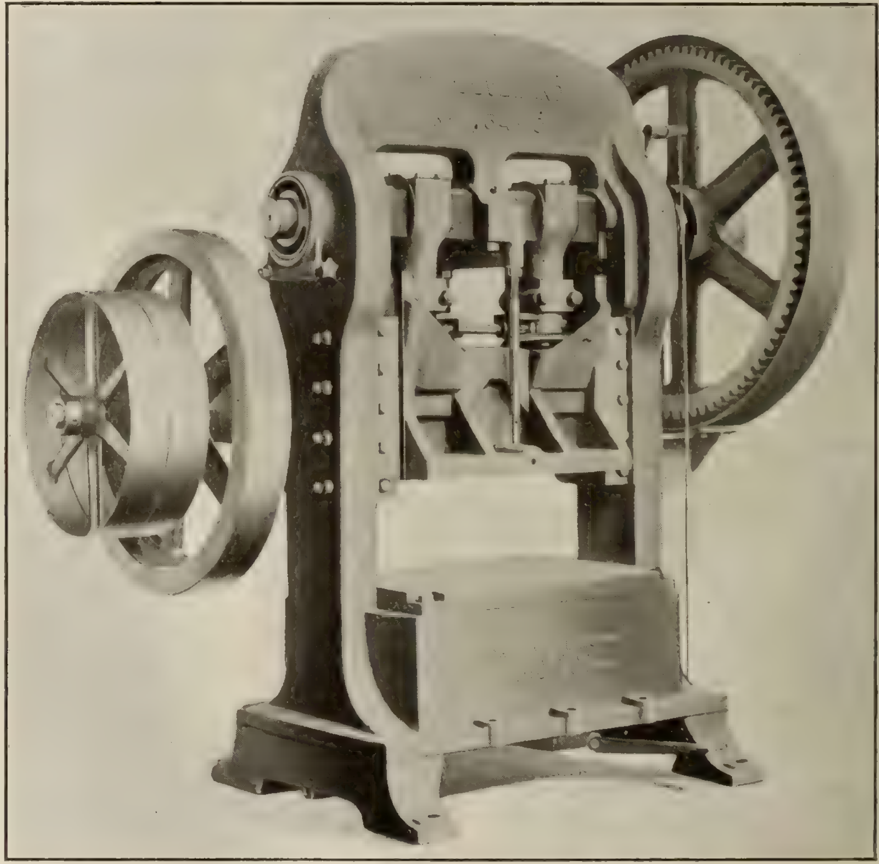
The No. 15 Lea-Simplex Machine will cut 5 in. round stock, 4½ in. square stock, 9 in. I beams on flat, and will also make angle cuts up to 55 degrees on smaller stock. The floor space of belt-driven machine is 31 in. by 46 in.; of motor-driven machine, 31 in. by 53 in.; and the speed of drive pulley is 285 R.P.M.

* * *

DOUBLE CRANK, GEARED POWER PRESS.

THE double crank geared power press described and illustrated is one of a line of presses recently produced by the Cleveland Machine & Mfg. Co., Cleveland, Ohio.

In designing this machine, the manu-



DOUBLE CRANK GEARED POWER PRESS.

facturers took pains to eliminate all the known weak points in other presses of this type. The weak part of the housing, which was around the shaft opening, has been reinforced 25 per cent. The arch and bed are of extra deep section, and the slide is reinforced to do away with practically all deflection when using large forming or embossing dies. Knock-out rods are attached to the centre bearing cap for ejecting formed and drawn parts from the upper die. When desired, the beds of these presses are fitted with a drawing attachment, which is also used as a knock-out device for ejecting work from blanking and forming dies.

These presses are fitted with either a positive steel clutch or a powerful multiple disc friction clutch, which may be either automatic or hand operated. The friction clutches are used principally on the larger presses or those having long strokes. For the sake of safety the gear and pinion are fully covered with a cast iron guard.

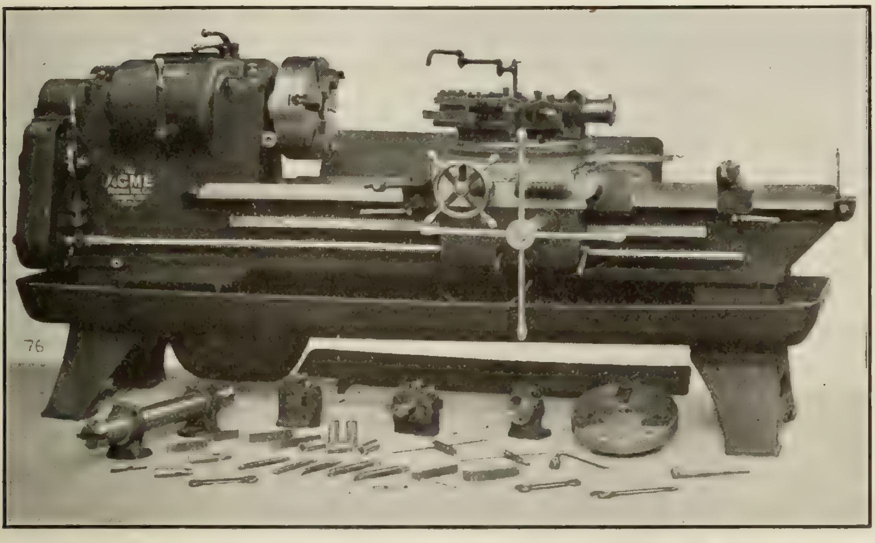
These presses are being built in nine sizes, ranging from a 3-inch shaft to a 12-inch shaft, and each size is built in several widths. Patterns are constructed so that many dimensions of these presses, such as stroke of slide, distance from bed to slide, or die space, opening in bed, etc., can be varied to meet special requirements at only slight additional cost. The principal dimensions of the machine shown are as follows:—

Weight, 28,000 pounds; distance between uprights, 49 in.; bed area, front to back by right to left, 36 in. x 48 in.; opening in bed, front to back by right to left, 24 in. x 38 in.; area of slide flange, front to back by right to left, 26 in. x 39 in.; stroke of slide, 6 in.; distance bed to slide, stroke and adjustment up, 17 in.; adjustment of slide, 3 in.; proportion of gearing, 7½ to 1; diameter of large gear, 60 in.; weight of balance wheel, 1,400 pounds; size of pulleys, 36 in. x 6 in.; capacity, 175 tons pressure.

◆

ACME COMBINATION FLAT TURRET LATHE.

THE Acme combination flat turret lathe is the product of the Acme Machine Tool Co., Cincinnati, Ohio. As implied, these tools are adaptable to both bar and chucking work. The maximum capacity for the former is ¾ in. diameter x 36 in. long, while all classes of chucking work up to 16 in. diameter can be machined. The actual swing over the bed is 22 inches.

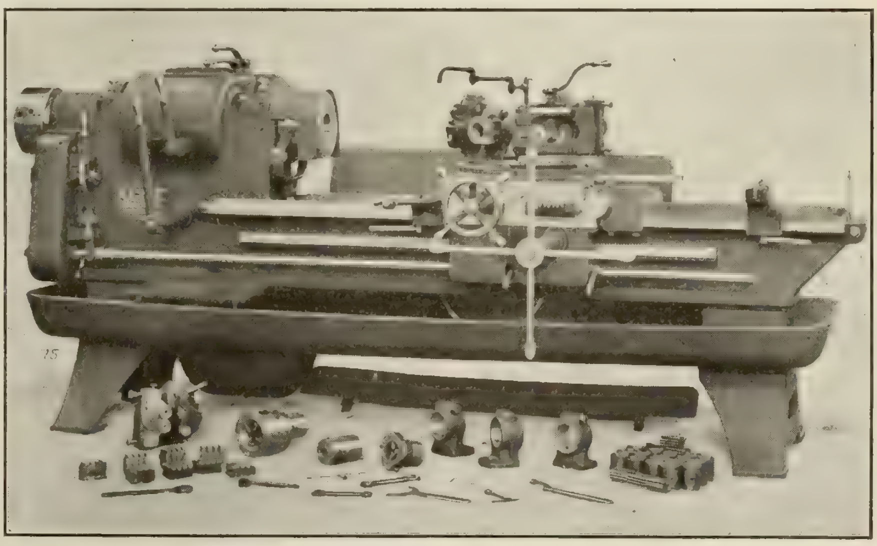


CINCINNATI ACME FLAT TURRET LATHE WITH CHUCKING EQUIPMENT.

The bed is of a heavy deep box section, strongly ribbed to withstand all cutting strains when the maximum pulling power of the geared head is being utilized. The bed rests on a three point bearing. The pan blocks and tank are cast solid with the pan, which is made unusually deep to provide for a large quantity of chips. A perforated cover serves as a strainer, allowing the oil to drain back into the tank. A geared pump is furnished, which provides an ample supply of oil when the machine is running in either direction.

The geared head is simple in construction, and a maximum pulling power, together with nine different speeds, is acquired with a minimum number of gears continuously running in an oil bath. The different speeds ranging from 14 to 285 r.p.m. are obtained quickly and without noise, and are controlled by the two levers conveniently located at the front of the head. The spindle is made of high carbon hammered crucible steel forged from the solid, and is mounted in renewable bearings of babbitt. By means of a double cone friction operated by a lever at the front of the head the spindle can be instantly started, stopped and reversed. Rigidity, accuracy and simplicity are insured by casting the head solid with the bed. A 12 in. single pulley running at a constant speed of 600 r.p.m. and driven by a 3½ in. belt delivers power for all turning, boring and forming operations.

The positive automatic chuck is especially designed to insure holding the work accurately and with great gripping power. It can be opened and closed while the machine is running by the long lever at front of head. The distinctive features are that the work does not have end motion while chuck is being closed, thus producing accurate shoulder lengths. The master-collet parts that hold the jaws are held fast against the closing ring, which prevents all dirt and chips from getting between them. This prolongs to a great extent the accuracy of the chuck. The jaws do not collapse, and extremely short work can be held without tilting. For variations in dia-



CINCINNATI ACME FLAT TURRET LATHE WITH BAR EQUIPMENT.

meters, adjustment for 1--6 in. larger or smaller is provided. The jaws can be easily removed without dismantling the chuck. To insure accuracy and long life, all working parts of the automatic chuck are hardened and ground, and the chuck jaws are hardened, but not ground unless specially ordered.

The simplex roller feed is extremely simple in design and operation, as only one adjustment is necessary. By adjusting the jaws to the size of stock with a spanner wrench, then slightly releasing them, the rollers will have the proper tension. The roller feed is operated by the same lever that actuates the automatic chuck.

The cross sliding turret revolves on a hardened and ground stem of large diameter, and is automatically locked into position by a hardened and ground tool steel taper plunger placed directly underneath the cutting tool. This plunger works in hardened ground taper bushings let into the solid turret and as near the outer edge as practicable. The turret is further held down at the extreme outer edge with circular clamps. Oiling arrangement is provided so that oil can be fed to each individual tool. The cross slide moves on a long narrow dove-tail guide, with wide flat bearing surfaces on either side, and has an adjustable taper jib to compensate for wear. It is also provided with an adjustable hardened centre stop. The cross feed, which is operated by hand or power in both directions, is furnished with a large graduated pilot hand wheel to facilitate in forming operations. The saddle has a continuous bearing on two exceptionally heavy vees on the bed, and carries the swinging stock stop, which is adjustable, attached to the front.

The stops are especially noteworthy because of their simple and fool-proof construction, positive action, and convenience in operation. Twelve longitudinal stops are provided, one independent stop for each turret face, and six auxiliary stops which are operated by the knob on the front of the saddle, which can be used in any combination desired with the independent stops. The cross feed has eight stops controlled by the knob on the front of the slide, which can be used to advantage in conjunction with the large graduated pilot hand wheel. These stops are arranged to trip the power feed in either direction. When doing chuck work as many as seven different lengths can be turned without indexing the turret. Safety stops are provided to trip the power feeds in all directions. All working parts are protected from dirt and chips, which adds to the accuracy and output of the machine. The feeds for both the longitudinal and cross movement are of the geared type. All feed changes are instantly obtainable by the lower lever, and can be reversed through the upper lever, both located on the front of headstock. All feeds can be changed and reversed without stopping the machine.

The reinforced apron is of the double wall construction, and all shafts and studs are supported on both ends. It is securely bolted and keyed to the bottom of the saddle, and provides a double bearing support for the feed rod which is driven by a knuckle joint coupling at head end. An adequate oiling system, which adds considerably to the life of the machine, has been amply provided for.

Centralized control, one of the very important features, has been well provided for. The time between operations has been reduced to a minimum by placing the various levers, such as the longiturinal turnstile, cross feed hand wheel, cross and longitudinal stops and power feed levers, binder handle and stock stop directly in front of the operator.

◆

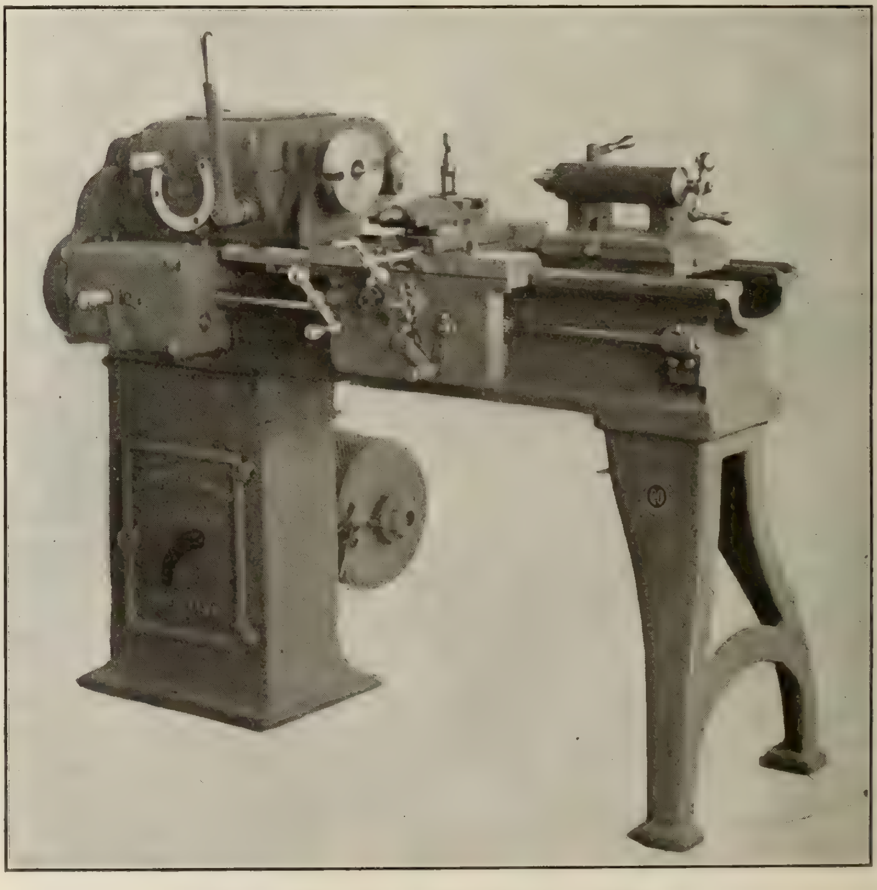
HIGH SPEED RAPID PRODUCTION LATHE.

THE illustration and description refer to a new type high speed rapid production lathe, designed and brought out by the Conover-Overcamp Machine & Tool Co., Dayton, Ohio, for the the Fort Wayne electric plant of the General Electric Co., and is something new in the matter of lathe design. It is of the single pulley drive, all-geared-head type, arranged for either motor drive or drive through countershaft; it has four all-geared mechanical speeds, and the main drive is a friction drive in the headstock. Through this friction the lathe can be stopped, started and reversed without stopping, starting or reversing the motor. The operator has full control of the machine at all times.

The machine, a 12 in. swing by 4½ ft. bed, was designed to meet a maximum spindle speed of 1,500 r.p.m., which is a high speed for an all-geared-head lathe, and under test this spindle was run up to a maximum of 3,500 r.p.m. At this speed the gears ran perfectly quiet and the machine could be stopped, started and reversed through the friction drive in the head.

The lubricant of the lathe has been laid out, and is obtained through the splash system, whereby all the journals in the head and the main spindle bearings are oiled through a felt system, wiping the bearings continually and keeping them well lubricated.

The vertical lever operates the stop, start and reverse, and the radius plate with the holes indexed operates with four changes of speeds. These changes can be made while the machine is running at its maximum speed. The lathe has four changes of positive geared feed. The apron is of standard type. This lathe is also built for small high speed chucking work as well as for regular turning.



HIGH SPEED RAPID PRODUCTION LATHE.

GENERAL INDUSTRIAL GOSSIP

A Review of Developments in the Industrial World which Make for Higher Degree Achievement along Economic Lines Through Concentration and Conservation of Effort

EXTINGUISHING FIRES IN OILS AND VOLATILE LIQUIDS.*

Edw. A. Barrier.

THE extinguishing of fires in oils and in most of the volatile liquids has always been a difficult problem, and where fires of this kind occur, the results are frequently very disastrous. Our most common extinguishing agent, water, works rather unsatisfactorily upon the majority of such fires, but it is still the only one available where heroic measures are required. Comparatively recently, however, there have been two or three other materials introduced for use as extinguishers which have shown some promise for dealing with these fires, and it is the purpose of this paper to discuss these materials and the conditions under which they prove the most efficient.

Not all fires in volatile liquids are difficult to handle with water. When the liquid is miscible with water, this extinguishing agent can be successfully used. Examples of this kind are denatured alcohol, wood alcohol, grain alcohol, acetone, etc. Where the liquid is not miscible with water, little or no effect is produced except to wash the burning liquid out of the building where it may be completely consumed, or, if the quantity of oil is small, possibly to extinguish the fire by the brute cooling effect of a large quantity of water sprayed upon the fire. Soda and acid extinguishers are somewhat more effective than pure water, but even they fail under most conditions. The various grenades containing salt solutions which were formerly extensively exploited are, of course, practically worthless.

The only principles that can be made use of in extinguishing fires in volatile oils are:—(a) To form a blanket either of gas or of solid material over the burning liquid which will exclude the oxygen of the air; or, (b)—To dilute the burning liquid with a non-inflammable extinguishing agent which is miscible with it.

Sawdust and Bicarbonate of Soda.

To the blanketing type of extinguishers belongs sawdust. Paradoxical as it may seem, ordinary sawdust is an excellent extinguishing agent for certain volatile liquids, especially those of a viscous nature. A considerable number of experiments were conducted in the fall of 1912 by the inspection department of the Associated Factory Mutual Fire Insurance Companies, in the extinguishing of fires in lacquer and gasoline in tanks with sawdust, and the results were surprisingly satisfactory.

The liquids were placed in three tanks 30 in. long, 12 in. wide and 16 in. deep; 48 in. long, 14 in. wide and 16 in. deep; and 60 in. long, 30 in. wide and 16 in. deep. The sawdust was applied with a long-handled, light but substantially built snow shovel, having a blade of considerable area. In every case the fires were extinguished readily, especially in the two smaller tanks, which were about as large as any ordinarily employed for lacquer in manufacturing establishments.

The efficiency of the sawdust is undoubtedly due to its blanketing action in floating for a time upon the surface of the liquid and excluding the oxygen of the air. Its efficiency is greater on viscous liquids than on thin liquids, since it floats more readily on the former than on the latter. The sawdust itself is not easily ignited and when it does become ignited it burns without flame. The burning embers have not a sufficiently high temperature to reignite the liquid.

The character of the sawdust, whether from soft wood or hard wood, appears to be of little or no importance, and the amount of moisture contained in it is apparently not a factor, so that the drying out of sawdust when kept in manufacturing establishments for a time would not effect the efficiency.

It was found that the admixture of sodium bicarbonate greatly increased the efficiency of the sawdust, as shown both by the shortened time and the decreased amount of material necessary to extinguish the fires. A further advantage of the addition of bicarbonate of soda is that it decreases the possible danger resulting from the presence of sawdust in manufacturing plants, since it would be difficult, if not impossible, to ignite the mixture by a carelessly thrown match or any other ready source of ignition.

Although the efficiency of the sawdust is greatest on viscous liquids such as lacquers, heavy oils, Japan, waxes, etc., in the tests referred to, fires were extinguished in gasoline contained in the smallest tank and also when spread upon the ground. In larger tanks, the sawdust or bicarbonate mixture does not work so well since the sawdust sinks before the whole surface can be covered, whereupon the exposed liquid reignites.

Carbon Tetrachloride.

In recent years carbon tetrachloride has received considerable attention as a fire-extinguishing agent. This is due largely to the activity of certain manufacturers of fire extinguishers which use liquids, the basis of which is carbon tetrachloride. This substance is a water white liquid and possesses when pure a rather agreeable odor somewhat similar to chloroform. A considerable proportion of the commercial article upon the market, however, contains sulphur impurities which impart a disagreeable odor to the liquid. The substance is quite heavy, its specific gravity being 1.632 at 32 deg. fahr. It is non-inflammable, non-explosive, and is readily miscible with oils, waxes, japan, etc. When mixed with inflammable liquids it renders them non-inflammable provided a sufficient quantity is added. Its vapor is heavy, the specific gravity being about five and one-half times that of air, consequently it settles very rapidly. As an extinguishing agent, it dilutes the inflammable liquid rendering it non-inflammable, or at least less inflammable, and it forms a blanket of gas or vapor over the burning liquid which excludes the oxygen of the air.

Although this paper is confined to a discussion of extinguishing fires in oils and volatile liquids, it may not be out of place to mention that the claims made by certain manufacturers producing extinguishers which use liquids, the basis of which is carbon tetrachloride, are grossly exaggerated. These preparations none of which is more efficient than carbon tetrachloride, are not the equivalent of the ordinary water extinguishers for general use on such materials as cotton, wood, paper, oily waste, etc.

On volatile liquids, oils, etc., carbon tetrachloride has, however, shown very satisfactory results under some conditions, but the readiness with which a fire can be extinguished with it depends to a considerable extent upon the skill of the operator and the nature of the fire. In tank fires the length of time that the liquid has been burning is an important factor, and in such cases where the sides of the tank become heated the only way in which the fire can be extinguished is to squirt the liquid forcibly at the sides. If the carbon tetrachloride is squirted directly into the liquid it is much more difficult, if not impossible, to extinguish the fire.

The height of the liquid in the tank is also a very important factor. Where the liquid is low the sides form a pocket which retains the vapor and aids considerably in smothering the blaze. When the tank is nearly full, however, this condition does not exist, and it is then very difficult, if not impossible, to extinguish a fire in a highly volatile liquid, such as gasoline; only the most skilled operators are successful in these cases. The size of the tank or the extent of the fire if upon the floor is, as would be expected, of considerable importance. In tanks larger than about 28 in. by 12 in. more than one extinguisher and operator working at a time are necessary to extinguish a fire in such materials as gasoline. In one test where a tank 60 in. by 30 in. was used no less than seven operators were necessary, and even then it was only with the greatest difficulty that the fire was put out.

---

*From a paper read recently before the American Society of Mechanical Engineers.

All of the above remarks apply to carbon tetrachloride in the ordinary one-quart extinguisher as generally sold. It is probable that a large extinguisher which could throw a large stream would prove more efficient, but on account of the great weight of carbon tetrachloride such an extinguisher would have to be specially designed to make it readily portable by mounting on a truck or some similar means. Expelling the liquid by means of a hand-pumping arrangement would probably be unsatisfactory, and it would therefore be necessary to force it out in some other way.

A few systems have recently been installed in which an elevated tank containing carbon tetrachloride was connected with automatic sprinklers or perforated pipes located in hazardous rooms where volatile and inflammable liquids are in use. So far as is known none of these systems have as yet been called upon to extinguish a fire, but there appears to be no reason why such a system should not provide excellent protection in special cases. In such systems it would be necessary to consider the safety of the workmen and furnish ready means of escape, since carbon tetrachloride is an anesthetic and where thoroughly sprayed through the air as from an automatic sprinkler it would probably produce rapid results.

The Fumes Feature.

The nature and effect of the fumes given off when carbon tetrachloride is thrown upon a fire is a subject which has received a great deal of discussion. When the liquid comes in contact with a fire the vapor is partly decomposed resulting in the evolution of a considerable quantity of black smoke which is undoubtedly finely divided carbon. Pungent gases are also produced which appear to be mostly hydrochloric acid with possibly a small amount of chlorine. Since carbon tetrachloride contains no hydrogen from which hydrochloric acid could be formed this substance must be produced by the action of chlorine on the gases arising from the burning material or upon the moisture of the air.

The fumes of carbon tetrachloride although of a very pungent nature do not produce any permanent injury under ordinary conditions where the operator can make his escape after he has inhaled all that he can stand, but they are a distinct handicap in fighting a fire and are one of the objectionable features to carbon tetrachloride as a general fire extinguishing agent. In large rooms or where a small quantity of carbon tetrachloride is sufficient to extinguish a fire the gases are, of course, less objectionable.

Frothy Mixtures.

Another method of extinguishing fires in oils and volatile liquids which has recently been proposed and experimented with is that of using frothy mixtures. The idea seems like a very promising one and the tests which have been thus far reported indicate very satisfactory results. The idea was originated and has been developed in Germany. So far as is known no experiments have been conducted in this country.

The process consists essentially in causing two liquids to mix in a tank where foam is produced. The tank is made air-tight and sufficiently strong to permit of the foam being forced out by carbon dioxide under pressure, and the foam is conveyed to the fire by means of a line of hose. The exact nature of the liquids has not been disclosed, but one of them probably consists of a sodium carbonate solution containing froth-forming ingredients such as glue or casein and the other an alum solution. The two on coming together generate carbon dioxide which produces froth. This froth is reported to be quite stiff and to shrink in volume but a comparatively small amount even after a period of half an hour.

A number of tests were conducted in the winter of 1912 in Germany; some of them on a considerable scale. In one case as much as 5 tons of crude naphtha in a tank was involved, and in another an area of 1,300 sq. ft. of burning tar was used. In all cases the results were reported satisfactory, the fires being extinguished in a short time.

The frothy mixture undoubtedly owes its efficiency to its blanketing action in settling upon the surface of the burning liquid, thus excluding the oxygen of the air, and to the fact that the bubbles of liquid contain carbon dioxide which upon bursting produce an atmosphere in which combustion cannot take place.

According to the latest reports, the matter is still in an experimental stage, various details regarding the form of apparatus, most efficient pressure, and design of nozzles being under consideration; but from what has already been done it would appear that the idea is a very promising one, and that this method of extinguishing fires in oils and volatile liquids will prove to be by far the most efficient of any that has as yet been suggested.

* * *

State Department Revenues.

Revenue of the State Department from the Incorporation of Companies in the first seven months of the fiscal year shows a decrease in comparison with the corresponding period. The total was $140,165, as against $157,187 in the seven months last year. The fees were unusually large last year on account, not only of the number of companies, but the unusual capitalization of several of them. The revenue is based upon the capital.

* * *

Public Works Estimates.

Estimates totalling fifty million dollars have been prepared by the Public Works Department. This is about two million in excess of last year. The budget will have to be revised by the Treasury Board. No new works are provided for, but those in progress already are so extensive and require such a large outlay, that it is difficult to reduce the amount. Harbor improvements, dredging and the construction of drydocks provide the principal items.

* * *

Stratford, Ont., Factories.

With the largest membership in its history, 150, the Board of Trade on November 21, met in annual session, heard encouraging reports and adjourned to the Windsor Hotel for dinner. Two of the city's largest manufacturers and veteran Board of Trade workers were the principal speakers at the banquet, Messrs. George McLagan and W. J. Mooney. The newly-elected officers are: President, A. C. McLeod; vice-president, H. W. Strudley; Secretary, F. A. Copus; auditor, G. L. McHattie.

The report of the council of the Board expressed gratification at the ten per cent. increase in population during the year, from 15,076 to 16,425; a creditable increase in factory output and the addition of new industries, such as the Farquharson-Gifford upholstered furniture factory, the Classic Furniture Co., makers of bedroom furniture; the Whitesides Paper Box factory, and the taking over and doubling of the Mill Building Co.'s plant by the Canadian Allis-Chalmers Co. The capital invested in factories is now $3,972,500; there are 2,570 male employees and 606 female. During the year $1,573,211 was paid in wages, and the factory output was $6,359,936. The building permits totalled $299,431.

ENAMELING OR COATING STEEL AND IRON WITH GLASS.*

By Raymond F. Nailler.

BEFORE going into the technology of this art, it will be interesting to note its history in a general way: where it originated and how it was brought down to the present age. The covering of burnt earthenware, porcelain and some metals with a crude enamel took place about the same time as the discovery of glass. Since the time when man first enameled metals, especially gold, silver and copper, he began to be interested in the problems connected with artistic enamels.

Colored enamel earthenware has been found in the ruins of Thebes. In the ruins of a great many other ancient cities of Egypt enameled or glass-covered brickwork has also been discovered. That the Egyptians knew how to adorn silver vessels with enamel pictures has been recorded by Pliny the Elder. From Egypt the enameling arts were transferred to Greece and thence to Rome, and some historians maintain that the enameling art came to Italy by Arabia, Spain and the Balearic Islands, and through Roman expeditions the art passed into England, France and Germany. In the museum at Oxford is an enamel ornament which was found in Somerset, the inscription of which dates to the time of Alfred the Great.

Early Art Enameling.

As a particular example of early art enameling let us briefly consider the so-called enamel painting. Two periods may here be distinguished: The first, known as the "old Limoges style," was characteristic of the time of Francis I. (1515-1547). The enamel plate, generally made of copper, was covered with a dark enamel coat. After firing, figures, weaker or stronger according to the relief desired, were put on with white enamel and the impression of bas-relief thereby brought about. The second period of enamel painting began a generation after the first. This is the so-called period of the "miniature style" which was introduced about the middle of the sixteenth century. It was brought to an extraordinary state of perfection by Jean Petitot (1607-1690).

As the demand for the artistic enamels of antiquity and the middle ages increased, so the enameling of gold and silver gave way to that of copper vessels, and from this point, if we except the somewhat scattered industry of miniature painting on boxes, such as jewel cases, etc., the absolute decline of the enameling art is to be recorded.

In the nineteenth century, which it must be conceded brought one of the most important of Europe's social, educational, and technical revolutions, the enameling business came into great significance and eventually became the enameling industry of to-day. The commercial introduction of iron and steel made it possible to re-apply the half-forgotten art of enameling iron utensils. In the history of the development of enameling or the modern industrial technology of iron enameling, we are able to speak of two periods with regard to the iron materials employed, viz., of the original enameling of cast iron exclusively and the later application to sheet metal.

The Word Enamel.

Before considering the technology of any particular type of enamel it will be well to consider the meaning conveyed by the word enamel. If the present-day enamel be briefly and scientifically designated as a boro-sodium-potassium-aluminum silicate generally colored by metallic oxides, then the following definition given by Popelin deserves to be quoted since this, notwithstanding its length, may be described as most clear and comprehensive: "Enamel is a glass fusible at a low temperature and usually compounded of borates and silicates. This mixture, originally colorless, combines with the greatest ease with metallic oxides under the influence of a pyrotechnic operation, thereby acquiring various colors according to the nature of the oxide which the enameler can vary at will."

Commercial Enamel.

The uses to which the general class of ceramic compounds known as enamel is put are varied. We have noted that enamels are used for artistic or decorative purposes. Parallel to this use we may classify a far more important type of enamels as "commercial," and it is with this type of enamel that we are to concern ourselves.

The first class of commercial enamels is that used on cast iron and this classification includes the field of sanitary equipment together with various forms of cast-iron kettles and similar pieces of engineering apparatus. The enameling of sheet steel may be taken as the second class of commercial enamels. The most familiar division of this class includes cooking ware enamels. The various forms of so-called agate and granite ware as well as the single colors are made by enameling sheet-steel forms. The second class of steel enameling which has more recently come into industrial importance is the manufacture of enamel signs, and the third field includes the manufacture of heavy equipment for large scale food preparation, the dairy industries, and general chemical operations. The apparatus in this last case may take the form of tanks, kettles, evaporators, pipes, etc.

In outlining the technology of the enameling industries as a whole we may include to a certain extent all of the above commercial classes, certain details of which are varied to meet the conditions of cast iron and various types of sheet-steel products. The outline following, however, is characteristic of all classes.

General Process Characteristics.

The first step to be considered is the preparation of the enamel. The purity of the raw materials to be used in the compounding of an enamel must be certain and in the cases where materials can vary in strength the actual analysis of the substance must be known to assure proper results. In many cases the secret of an enamel lies in its formula and so the compounding of the batches is very carefully guarded, only a person of responsibility having charge of weighing the ingredients. The various materials are generally kept in bins which are numbered, the person in charge of the mixing having the formula stated in terms of these numbers. The properly weighed batch is thoroughly mixed, this being accomplished either by shoveling carefully on a specially prepared floor or by mechanical mixing by means of a rotating agitator.

The product of the mixing room is taken to the smelter in which the various ingredients are fused together in the form of a mass having the characteristics of glass. The furnace in which this operation takes place is a special reverberatory furnace similar to that used in the puddling process in the manufacture of wrought iron. The coal is placed on a grate at the front end of the furnace and the burning gases pass over the bridge wall, strike the roof, and are deflected against the batch. The first change which may be noted in the smelter is the driving off of the water from the borax which produces a swelling up of the mixture. The fluxing materials then melt down and as the heating is continued, dissolve the more refractory constituents.

If the batch is properly stirred and the temperature of the furnace carefully regulated, the product of this operation is a clear transparent glass containing no particles of unfused material. When a test of the fusion comes up to this standard the furnace is tapped and as the liquid glass flows into a tank of cold water it is broken up by the chilling action of the water, the result being a thorough granulation of the product. The material thus prepared is known as "frit."

The next step in the preparation of the enamel involves grinding the frit to a fineness at which it can be applied to the surface of the metal. The mill here used is the ordinary pebble mill lined with porcelain brick and containing very hard flint pebbles. In the cast-iron industry two general processes are used, the dry and the wet, in sheet-steel work only the wet. In the first case the frit is ground dry, the pulverized enamel being sprinkled on the hot cast-iron piece. In the wet process a certain percentage of pure white clay is placed in the mill with the frit and a certain definite amount of distilled water.

---

*From a paper read recently before the American Society of Mechanical Engineers.

When certain grades of enamel are to be manufactured various compounds are also added here to aid in producing desired colors, gloss and opacity. An instance of this is the addition of tin oxide in the mill in the production of white cooking utensil enamels. The fineness to which the enamel is ground depends upon the particular use to which it is to be put, manner of application and other factors. In the wet process the essential feature is that it be fine enough to remain suspended in the water assisted by the clay and the so-called "vehicles" mentioned below.

Material to be Enameled.

At this point we may take up the consideration of the construction and preparation of the material to which the enamel is to be applied. Cast-iron enamels are applied to castings of the desired shape. In the case of cooking ware enamels the shapes are constructed by pressing and spinning. For heavier equipment such as jacketed kettles the apparatus is constructed by riveting or preferably welding the sheet steel in the desired form. The selection of the steel with a view to its chemical analysis is of prime importance. A reliable specification reads as follows:

Sulphur	below 0.040
Phosphorus	below 0.030
Manganese	about 0.40
Silicon	about 0.010
Carbon	about 0.10

The steel must necessarily be free from laminations or other mechanical imperfections.

With reference to the construction of heavy apparatus the sheet ranges from 3-16 in. to ⅜ in. in thickness. Two general methods of construction are in use:

The first involves the formation of unit sections fitted with flanges. These sections are enemaled separately, bolted together at the flanges and the desired apparatus so constructed. The preferable practice, however, is to construct the apparatus in one piece by means of autogenous welding, thus avoiding the use of gaskets or other packing materials in erection. That the enamel may properly adhere to the surface of the metal, the latter must be free from dirt or scale, and in the case of welded joints the welds must have a preliminary grinding to reduce the roughness. The entire surface of the apparatus is then cleaned by pickling or sand blasting, the latter process being altogether used in cleaning large apparatus. As the crude ware leaves the sand blast it has a roughened, clean, metallic surface, and is in the proper condition to receive the enamel.

Enamel Application.

Before applying the enamel to the metallic surface it is prepared by a process known as "setting up." This involves the addition of certain chemicals to the enamel as taken from the mill, the function of this addition being to assist the clay in holding the enamel particles in suspension. Substances so added are termed "vehicles." At this stage the enamel must be diluted with distilled water to the proper consistency for application.

In applying the enamel to the metallic surface, three general methods are in use:

The first, applicable to small pieces only, is known as "dipping," the piece being dipped into the enamel, the excess of which is shaken off, leaving a thin coating on the metal. The second method, known as "slushing," involves pouring the prepared enamel over the surface and allowing it to drain. The third method, which is the principal one used on larger apparatus, involves spraying the finely ground enamel on the metallic surface by means of the compressed air atomizer.

Furnace Type.

Preliminary to the consideration of firing the enamel we may review the types of furnaces in use. The first type is known as the muffle furnace, and involves the use of a large fire clay oven externally heated by means of coal, gas or other fuel. The apparatus to be fired is placed on suitable supports in this muffle. The other type of furnace is known as the direct fire furnace, in which the heat from the fire is taken up by the walls of the firing chamber and radiated to the apparatus placed within the chamber on suitable racks. This general class of furnace has two special divisions in that, on the one hand, the piece is rotated within the furnace, while on the other hand, the piece is allowed to remain stationary. For small work the muffle is in general use, but for the production of large apparatus the direct-fire furnace is necessary.

At first thought, the muffle furnace may be considered to have an advantage in that the products of combustion together with the dust from the fire cannot come in contact with the enamel. Again, it may seem that a more even heat can be realized in the muffle. On the other hand, with a properly designed direct-fire furnace in which the combustion is complete before the gases reach the firing chamber no trouble is experienced due to their presence or to the dust from the fire. The use of natural gas further does away with this latter possibility.

In a furnace for firing smaller ware, the charging mechanism is a fairly simple matter, it being necessary merely to place the material in the furnace by means of a small fork operated by hand or mechanically, but in the manufacture of engineering apparatus where a single piece may weigh 3,000 to 4,000 lbs., it is necessary to have a large mechanical charging machine on which the piece may be placed outside the furnace, the arm of the machine then properly placing it in the furnace. The general design of such a machine suggests the charger used in open-hearth practice.

The apparatus to which the enamel has been properly applied is placed in the furnace which is maintained at the proper temperature. This temperature varies with the nature of the enamel and in cases of high silicon acid-proof enamels reaches in the neighborhood of 2,500 deg. Fah. The control of the burning is made possible by the changes which occur in appearance of the enameled surface as fusion takes place.

Enamel Composition.

Nothing has been said so far as to the composition of the enamel or of the number of coats applied. In general, there are two kinds of enamel, known as ground coats and cover coats. The former serves as a bond between the enamel and the steel, and the latter serves to build up the body of the enamel and presents the finished surface. In the ground coat, color is no object. Its composition is such as to render it adherent and strong. In addition to the ordinary components cobalt oxide seems to be essential to the production of adherence. The explanation of this is debatable. The cover coat is the one which forms the major part of the enamel and if definite color, opacity, etc., are objects, the necessary ingredients for their production are introduced here, assisted by mill additions as noted above.

In the manufacture of acid-proof enamel, the cover coat is essentially a high silicate and must be free from any metallic oxides, such as oxide of tin, lead, iron, etc. The piece to be enameled receives one ground coat which is burnt well into the steel at a high temperature. The cover coats may be one or two in number for ordinary enameling, but should be at least triple for acid-proof work.

IRON ORE BOUNTY PROPOSAL.

IF the iron ore used in Canada, 93 per cent. of it comes from the United States. This is the figure given by the Port Arthur Board of Trade, who are endeavoring to induce the Dominion Government to give a bounty of fifty cents for every ton of iron ore mined in Northern Ontario. The figure seems rather large in view of the enormous amount that is imported into Nova Scotia from Newfoundland, and the considerable quantity imported from England when the price is low enough, but, whatever the figure, it is an indisputable fact that the amount of ore mined in Canada is almost infinitesimal. In view of the fact that an immense iron deposit has been discovered near New Hazelton, B.C., which an American mining authority says is as rich as anything yet discovered on the coast, the resolution passed by the Port Arthur Board of Trade, a copy of which has been sent to Mr. Borden, is of interest and importance to men in the iron and steel trade.

This resolution states that over 100,000,000 tons of iron ore have been proved to exist in Northern Ontario, and urges parliament to authorize the payment of a bounty of fifty cents per ton mined and smelted in Canada in the next ten years, such bounties in the aggregate not to exceed $1,000,000 in any one year. Then the demand for iron ore in Canada is comparatively small, and the supply from Michigan is too plentiful to tempt American steel concerns to come into Canada for it. The bounty as suggested by the Port Arthur Board of Trade is preferable to a protective duty, because a duty on iron ore coming into Canada would hamper still further the efforts of Canadian iron companies to make pig iron on a paying basis. It is strange that with all this ore lying hidden in Ontario it should be necessary for a Canadian Company to open mines in Venezuela. Such is the case, and the mines are supplying ore to the United States, and, we understand, are paying.

◆

PREPARING FOR COMING BUSINESS.

FEW industries just now are as scarce as hens' teeth, and happy is the city that can find one. So scarce are they, the tendency is to do away with industrial commissions. The commissioner who can induce an American manufacturer to come to Canada at present is a good business man, and worth his salary. Many of the best and surest propositions are held up through lack of capital and business. A Hamilton newspaper stated last week that a movement was on foot to do away with the office of industrial commission because no new factories were coming in. This would be a foolish move, and bad business. Manufacturers do not turn their expert mechanics away when hard times come. Even though no orders are in, they do their utmost to find something for them to do, be it only repair work. Municipalities should try to do the same with their industrial experts. Mr. Marsh, of Hamilton, is a smart and clever business man, who, like the busy bee, will improve each shining moment. A depression like the present is an excellent time to prepare plans for the big rush of industries which is bound to come next year, and the years following. This work, like other professions, requires preparation, and if Hamilton goes to sleep for a year, she will wake up to find wheels turning elsewhere.

Talking about industries reminds us of opportunities lost by Chatham, Ont., which is doing her utmost just now to secure a large match factory. On the authority of Alderman Arnold of that city, it is related that the H. Mueller Mfg. Co., a well known American firm of brass founders, offered to build their plant in Chatham if given a bonus. The proposition was turned down because a bonus was asked. The foundry was erected in Sarnia, where they got a $40,000 bonus, and are employing three times as many men as they bargained on. We do not favor the system of bonusing, but the practice has become recognized in Ontario, and until it is forbidden by law, the bird that provides the money early, gets the worm. The Remington Arms Co. also went to Chatham to erect a factory of seven buildings in which to manufacture ammunition. For some reason or other they were allowed to get away to Windsor, where they paid a high price for a site, and are now erecting their plant.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, December 8, 1913.—Business is very quiet in most lines and some houses report that, after a temporary improvement, collections are again becoming hard to make. In machinery circles, trade is dull, one or two small orders from the C.P.R. being all that have been placed during the past week. Mussens, Ltd., report a fair number of enquiries. This firm have just been appointed sole agents in Canada and Newfoundland for Detrick & Harvey, Baltimore, Md.

The Dominion Bridge Company have to-day been awarded contracts for four new steel bridges for the Intercolonial Railway. The Canadian Allis-Chalmers Co. have also received orders for three bridges to be located at West River, Barney's River and French River in Nova Scotia.

Metals.

There is a fair country demand for bar iron and also for general hardware, but in the city these lines are very quiet. The same may be said of pig iron, though some enquiries for 1914 requirements have been received.

With regard to steel it is not improbable that the near future will see a rise in price, since at the present time consumption is outstripping production. Prices are consequently very firm.

Toronto, Ont., Dec. 9, 1913.—The most important point in connection with the steel trade in Canada this week is that the railways, who have not been buying freely of late, are coming into the market for bars and railway fastenings. This should help the steel business, just as the demand by the railways for machine tools is keeping machinery agents from going to sleep.

Apart from that, the only other feature just now is that most concerns are closed down or about to close down for stock-taking. It is getting too near Christmas to sell much steel, and most agents have their men at home. The latter will be closed up too next week for stock-taking. The coming three weeks are usually the slackest of the year.

Reinforcing steel is very dull just now, only small lots being in demand. Pig iron is selling moderately well. Business in wire has been very fair; the same with nails. The demand for rivets, screws, etc., is keeping up, enabling plants to run at about six days a week. Most manufacturing concerns throughout the province have either laid off a large percentage of their men, or have decreased the number of working hours so as to keep all their hands at work. In Canada, labor is not so easily secured as to allow it to depart as soon as hard times comes along. The Moffat-Irving Steel Co., who have recently put an electric steel furnace into operation, have retained all their men, and have sufficient work to keep them going. Unlike some concerns, the work is coming to them. Prices have not changed. Steel shapes are quoted at $2.40 for warehouse on small pick-up orders, and $2.35 for larger orders.

Machine Tools.

In the machine tool business, it is one continual fight to get orders to make the getting profitable. The Kelsey Wheel Co., who were to have purchased machine tools several weeks ago, have now decided to bring the old machinery from their Detroit plant across the river to their new Windsor plant, and to purchase new machinery for the parent plant. Second-hand machinery can be imported cheaper. This company, however, does not expect to be making wheels until February. The Massey-Harris Co. have been buying milling machines this week.

Orders are being placed by the contractors on the new Welland Canal, both for machine tools, and for contractors' machinery.

Metals.

A large metal dealer when asked this week regarding business, said: "You can say business has emigrated. It is the worst we have known in fifteen years. Manufacturers are looking sick. Men who a year ago talked $5,000, can't now talk five tons. Some of the big concerns who buy as a rule in very large quantities, will not now even take what they ordered." He said quite a lot more that was equally pessimistic.

St. John, N.B., Dec. 6, 1913.—An immense factory is to be built at Coldbrook besides those already mentioned in these columns as projected or already completed there. The contract will probably be awarded next week. Tenders have been called and the work of construction is to commence as soon as the successful tenderer is decided upon. The Canada Nail & Wire Co., Ltd., for whom the factory is to be erected, is planning to have the works completed within three months and to start turning out their product in the spring. The new company has secured a site four acres in extent, facing Rothesay Avenue and just beyond the Ford automobile works. The plant will have a frontage of 175 feet on the avenue and a depth of 50 feet, with an L running towards the rear of similar dimensions. The main parts of the building will be of most modern design, one storey in height, with a two storey section at the corner, where the wings intersect, the upper storey to be used for a suite of offices.

The foundations are to be of piling surmounted by reinforced concrete and the superstructure will be of brick. A brick boiler house will be located at the rear of the front portion and in the angle formed by the L, entirely separate from the main buildings. The order has been given for the machinery for the new plant and the work of construction is to be hastened in order to have the plant ready when the machinery arrives. The company has been organized for the manufacture of horseshoe nails and horseshoe calks for both of which they feel there is a big field in Canada, there being only one other concern in the

Dominion producing the latter article. G. W. Wilson, of St. John, is the architect in charge of the plant.

Ex-Senator N. M. Jones, general manager of the Partington Pulp and Paper Co. interviewed Mayor Frink this week and asked for an extension of time by the city in the company's removal of the machinery of the Mispec pulp mill purchased by them. Fair progress has been made in the work of removal, but many of the larger pieces will require more time, and an extension beyond January 1 is asked. It is thought the demand will be granted.

Work on the construction of the western extension of the Aroostook Valley railway will be commenced in the spring. The surveys have been completed. This railway company has been incorporated under the name of the St. John & Quebec Railway. The line will connect with the St. John Valley Railway near Centreville. Premier Fleming said this week that the third section of the Valley Railway amounting to about 120 miles would be finished next year, construction being resumed in the spring.

There is a possibility of a branch plant being established in St. John for the manufacture of the Bolinder Marine Oil Engine. Captain Linde, representative of the Swedish Steel and Importing Co., of Montreal, was in St. John this week with a view to their introduction. He said he expected to establish an assembling plant in this city which would employ quite a number of men and be reckoned as an important industry.

Oxy-Hydrogen Torch.

A contemporary describes a new process for using the oxy-hydrogen torch under water for cutting metals, as in dismantling sunken ships. The torch is fitted with a bell-like head, which works in conjunction with a blast of compressed air. The system was recently tested in Kiel Harbour in a depth of 5 m. of water, when an iron case of 100 mm. by 20 mm. was cut through, a cut of 10 cm. length being made within 30 seconds. A piece of iron 60 mm. square was cut through in the same time, while in a sheet 20 mm. thick, a cut 30 cm. long was made in 1½ minutes. The pressure under which the oxy-hydrogen mixture of the cutting flame issues must be considerably increased, and the whole of the combustible gas must be consumed, and not only a part, as is the case with the oxy-acetylene torch.

Zinc Depositing.

A description of a German method of securing adherent deposits of zinc in galvanizing is given in "Mineral Resources of the United States for 1912." After steeping in sulphuric acid, the iron is placed in a solution of mercuric chloride and then heated, resulting in a decomposition of the mercuric chloride and precipitation of metallic mercury, which forms an amalgam of iron on the surface. The iron is then plunged into a zinc bath heated to 500 deg., where it remains three minutes. Microscopic investigation shows that the zinc penetrates into the pores of the iron, and in case a portion of the coating is worn or broken off, the iron does not rust, the presence of sufficient zinc in the pores preventing corrosion. The mercury is, of course, lost.

Concreting in Deep Water.

In depositing concrete in deep water through a funnel, the most difficult part of the operation, says the Engineering Record, is filling the tube at the start. As is well known, unless the tube is sealed in some way the cement will wash out during the downward passage and leave only a pile of stone and sand. This waste of concrete may in the case of a 12 in. tube, 50 ft. long amount to more than 1 cubic yard. A simple but effective method of preventing this waste was described at a recent meeting of the American Railway Bridge and Building Association at Montreal. A 7 in. or 8 in. layer of wood shavings is first inserted and is covered with about 1 in. of cement. This forms a plug, and as the concrete is dumped on top, the buoyancy of the plug and resistance of the column of water underneath prevent the first concrete from falling rapidly enough to wash out the cement; from then on, the concrete itself serves as a seal.

Fatigue or Negligence, Which?

Sir Charles P. Davidson, Chief Justice of the Superior Court of Quebec, will be called upon to decide whether a wiredrawer employed by the Steel Company of Canada in their Montreal plant who sustained injuries to his arm, was guilty of gross negligence or whether the accident was caused through unsteadiness due to fatigue. The man, whose name is Jack Miller, has entered action against the company under the Workmen's Compensation Act of Quebec. He was in charge of three drums at the wire plant, and, while at work, lost his balance, and in trying to save himself from falling, got his hand caught in one of the drums. His forearm was badly mangled. The Steel Company denies liability on the ground of negligence of the man. Miller denies negligence, and states that he had to remove the reels of wire as they were drawn, weighing from 150 to 200 lbs., and it could not be construed as negligence if at times he became tired and unsteady on his feet. The fatigue he argues, was due to the arduous work he was called upon to perform.

What is an abattoir?

Is an abattoir a manufacturing plant? The question is one of importance to the Dominion Abattoir, Ltd., London, Ont. When the city annexed some adjoining territory, it was agreed that new factories would be exempt from assessment, and taxed only on the value of the land. The owners of the Dominion Abattoir take the ground that theirs is a manufacturing plant, while the assessment department argue that it is assessable the same as a wholesale house. The matter was laid over for further consideration. We presume the decision will be determined by the extent of the business done by this company. If they simply prepare meat for consumption, they can hardly be considered manufacturers, whereas if, like many packers, they prepare fertilizers, lard, and the like, they might reasonably be considered as manufacturers.

A Tax on Machinery.

Towns and cities all over Canada have been thinking hard for the last few years on the question of how to induce manufacturers to locate within their boundaries. The Province of Saskatchewan is just now curbing a prevailing tendency by prohibiting the granting of bonuses to manufacturers. Quebec Province is also about to put power into the hands of municipalities to keep industries away, though this is not really the intention. The idea is to give municipalities power to tax all machinery within their limits as a means of raising revenue. It seems as though this will have the effect of keeping manufacturers away from Quebec to a greater or lesser extent, and certainly they will not be over-anxious to purchase new machinery and thus increase their taxation. This matter comes under the revision of the Municipal Code of Quebec, now contemplated by the Legislature. Several members, notably Lieut.-Col. Smart, member for Westmount, consider the measure opposed to the interests of the Province. Col. Smart thinks business is already taxed enough in Quebec. There are many mills and factories, he says, where the building is nothing more than a shell for the expensive machinery used. Every encouragement should be given to manufacturers to establish new factories in Quebec instead of driving them away, says the Colonel. A similar tax proposed three years ago was defeated.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Saskatoon, Sask.—The Metal Shingle and Siding Co., Ltd., Preston, Ont., will establish a branch here.

Toronto, Ont.—The Bawden Machine Co., Sterling Rd., have completed, and are now operating their foundry.

Port Arthur, Ont.—The Western Drydock Co. are now operating their new foundry which was built during the summer.

Ottawa, Ont.—The Campbell Steel and Iron Works, Ltd., Carling Ave, have started to build a new blacksmith shop, of steel construction.

Fort William, Ont.—The Dominion Iron & Steel Co. who own land on Island No. 1, will build a warehouse and dock here it is believed.

Maisonneuve, Que.—The Provincial government has given $500,000 and the city a site towards a technical school, which may be erected next year.

Dundas, Ont.— The Pratt & Whitney Co. will erect a new hardening room and a store-room, the whole building being 50 x 30 feet, and of steel construction.

Montreal, Que.—The Grand Trunk Railway System is in the market for new equipment, including 110 passenger coaches, 500 flat cars and 500 stock cars.

Regina, Sask.—The Regina Foundry Co., per C. B. Springstein, is one of many Regina firms who have asked the city to lend them a considerable sum of money.

Midland, Ont.—The Midland Malleable Iron Co., who were recently granted a large bonus by the ratepayers, are calling tenders on the construction of a railway siding.

Bedford, Que.—The entire plant of the Bedford Co., makers of axes, scythes, saws, etc., was burned to the ground on December 1. The loss of $75,000 is covered by insurance.

Winnipeg, Man.—Henry Birks & Sons, who will erect a large jewelery factory here, state that they will not be ready to supply information regarding equipment for six months yet.

Dundas, Ont.—The Canadian Abrasive Wheel Co., incorporated at Toronto last summer to manufacture abrasive materials, will erect their plant in the east end of the town next spring.

Niagara Falls, Ont. — The Oneida Community Co., who make iron traps and various other lines, are planning an extension to their plant for the coming year.

Galt, Ont.—The Galt Knife Co., Ltd., will erect a single storey factory, 45 x 140 feet here. Thomas Vair and his son Wardlaw Vair, formerly of the Peter Hay Knife Works, are the promoters.

Montreal, Que.—At the auction of the plant of the Star Iron Co., Ltd., of Beauharnois, Que., no sale was effected. The liquidators are trying to dispose of the plant privately.

Port Arthur, Ont.—A site has been purchased by a company who have a patented process for brazing iron, and who will establish a plant here to employ 40 hands.

Toronto, Ont.—R. C. Bartlett, 16 Spencer Avenue, has organized the Canadian Bartlett Automobile Co., Ltd., with $1,000,000 capital, to manufacture automobiles. He may build a plant here.

Kaslo, B.C.—James A. McIlwee & Sons, Denver, Col., who have secured the contract for driving ten miles of tunnel through Rogers' Pass, are erecting construction camps at both ends to start work January 1.

Cobalt, Ont.—One-half of the 80-stamp battery of the new Northern Customs Concentrator will begin operations on Dec. 15. This machinery was built in record time by the Wabi Iron Works, New Liskeard, Ont.

Hamilton, Ont.—The Hamilton By-Products Coke Ovens Co. who will erect a $1,000,000 plant here, the Ontario Pipe Line Co., and the Hamilton Gaslight Co., are reported all to be under the contract of the United Gas and Fuel Co.

Medicine Hat, Alta.—The Canada Cement Co. have erected a new machine shop at Plant No. 14, but have ceased construction work for the winter. Plans will be prepared for the remainder of the plant. The Hunt Engineering Co. have charge.

Toronto, Ont.—The Roofers Supply Co. will move their warehouse from the foot of Bay Street, to the old Pease Foundry at the corner of Shaw and Dupont Streets, where they have made additions and alterations. New equipment, consisting of shears, etc., will be installed.

Windsor, Ont.—The Parsons Motor Co. of Canada, Ltd., are contemplating the erection of a motor car plant here.

Hespeler, Ont.—The Canada Machinery Corporation will in future make all their woodworking machinery here. Their plant at Preston, known as the Ballantyne Foundry, will be closed, and machine tools moved to Hespeler.

Woodstock, Ont.—The Wayne Oil Tank & Pump Co. have rented the old Pneumatic Hammer building, which they will use as an assembling shop until their new plant is erected. Plans and tenders for the latter are in the hands of contractors.

St. Catharines, Ont.—The Confederation Construction Co. who have the contract for No. 3 Section of the new Welland Canal, have just completed the erection of two large machine shops. Excavations are being made for concrete beds on which to hold the machines.

Berlin, Ont.—The Buffalo Forge Co. of Montreal and Buffalo, who are erecting a large plant here for the manufacture of blowers, etc., have not yet prepared specifications for machine tools and other equipment required.

Toronto, Ont.—Rock and Power Machinery Ltd., who were incorporated recently to carry on business in Ontario as machinery agents, have opened offices in the King Edward Hotel, Toronto. Phil H. Moore, lately a mining salesman in the employ of Allis-Chalmers, Ltd., has been appointed manager.

Niagara Falls, Ont.—The Pollard Manufacturing Co. are making progress with the erection of their plant. The walls are up, and steel is on the ground, but they are not ready yet to purchase equipment. They make stone-cutting machinery and other lines, and are very busy.

London, Ont.—W. Metcalf, of the Metcalf Agencies, 252 Dundas St., maker of rope-making machinery, would welcome data regarding the supply of special cast iron and malleable iron, and general castings.

Vancouver, B.C.—Two weeks ago it was announced that the Hewitts, of Seattle, Wash., would erect blast furnaces in or near to Vancouver. It is understood that they will be supplied with iron ore by the North Pacific Co., of Prince Rupert, B.C., who control an immense iron deposit recently discovered near New Hazelton.

Coldbrook, N.B.—The Canada Nail & Wire Co., Ltd., have called tenders for the erection of a one-storey plant, 175 x 50, to be completed in three months. Horse shoe nails and calks will be manufactured. Equipment will be required for the boiler house, and some machine tools, though it is understood that the principal machinery has been purchased. Garnet W. Wilson, St. John, N.B., is the architect.

Windsor, Ont.—The Remington Arms-Union Metallic Cartridge Co., Bridgeport, Conn., are erecting a plant at Windsor, consisting of seven one-storey buildings, of brick and steel, with saw-tooth roof. One building is already completed. The equipment will consist of the most modern automatic machinery, with safety devices and fire protective apparatus. The principal product will be shot gun ammunition.

Exeter, Ont.—The Exeter Mfg. Co., Ltd., have been incorporated at Toronto, capital $20,000, to take over as a going concern the business of founders and machinists heretofore carried on under the name of James Murray & Son, at Exeter, and all the assets and liabilities of that firm; to carry on the business of manufacturers of bells, roadmaking tools and machinery, concrete block and other moulding machinery, cast iron culvert and other pipes, wheelbarrows, pumps and other hardware specialties. Incorporators: Ralph Y. Struble, Frank B. Zieg, etc., Fredericktown, Ohio.

Toronto, Ont.—John T. Hepburn, Ltd., has been incorporated at Toronto with a capital of $200,000 to manufacture cranes, brick machinery and other implements and machinery, and to carry on the businesses of tool makers, brass founders, metal workers, boiler makers, iron masters, iron founders, engineers, builders and machinists in all their respective branches; to acquire also the foundry and machine shop business now carried on by John T. Hepburn in Toronto. Incorporators: John F. Boland, Frederic J. Boland, etc., Toronto. It is understood that extensions to the plant will not be made until a future date.

Windsor, Ont.—The Ontario Steel Products Co., Ltd., a merger of several of the spring and axle makers in Ontario, have purchased land on which they will erect a spring factory early next year. The new equipment required will consist of a full supply of modern spring-making machinery, machine tools for various kinds of work including the making of dies, etc. The first building will be 175 by 60 ft., designed to permit of extension. The plant will be a branch of the Dowsley Spring & Axle Co., Chatham, Ont., and will be operated by natural gas. W. T. Sampson, general manager, Gananoque, Ont.

Vancouver, B.C.—It is understood that Yarrow & Co., the Glasgow shipbuilders, have bought the plant of the Wallace Shipyards, Ltd., at North Vancouver, as the nucleus of a larger plant. The latter are not yet prepared to make any statement, but it is believed that the deal has been accomplished. The Wallace shipyards consist chiefly of repairing slips.

Electrical

Galt, Ont.—Four-globe ornamental lights are desired by residents on Water Street south.

Edmonton, Alta.—White way lighting will be undertaken by the city as soon as the ordinary street lighting is completed.

Chapleau, Ont.—The Chapleau Light and Power Co. is installing a large new generator in its plant.

Forest, Ont.—The ratepayers have granted the council authority to spend $6,000 on extensions to the electric light system.

Verdun, Que.— The Verdun council are asking the Quebec Legislature for power to construct conduits for electric wires.

Sydney, N.S.—The Cape Breton Electric Co. are installing a 400 k.w. motor generator set in their Sydney power house.

Richmond Hill, Ont.—The town will spend $4,000 on a municipal electric light system if the by-law for this is passed on January 5.

Tilbury, Ont.—The ratepayers will vote on a by-law to provide $10,000 for a distributing plant under a contract proposed to be made with the Ontario Hydro-Electric Commission.

Toronto, Ont.—The Hydro-Electric Commission of Ontario is making tests of a new German street light which, it is claimed, will sell very cheap.

Battleford, Sask.—The town of Battleford recently contracted with North Battleford for a year's supply of electrical energy at the rate of 5c per kilowatt hour.

Weston, Ont.—Weston Electric Light and Waterworks Commission are interested in the proposed extension of the Hydro-Electric line to the villages of Thistletown, Woodbridge and Bolton. Weston is the nearest distributing station, and the current may be supplied from there.

Fort William, Ont.—The council will shortly submit by-laws to the ratepayers authorizing the expenditure of $115,000 for electric lighting purposes, and $238,000 on the street railway.

Moose Jaw, Sask.—The Light and Power Committee have instructed the electrical superintendent to secure two 100 k.w. transformers from the Canadian Maloney Electric Co., Windsor, Ont., at $938.

Saskatoon, Sask.—The city offers to construct a line from the power house to Factoria, and supply current to manufacture at $2.20 per k.w. if an agreement be made to use $14,000 worth annually.

Sudbury, Ont.—The ratepayers on December voted in favor of a ten-year agreement with the Wahnapitae Power Co.; also to expend $9,844 on an electric light system extension, and $25,000 for sewers.

Brandon, Man.—The power rights on the Assiniboine and Little Saskatchewan rivers for about fifty miles on either side of this city have been reserved for municipal uses by the Dominion Government.

Hamilton, Ont.—Manager Sifton, of the Hydro department, says the city will do the work necessary to supply Barton Township with power, but the Commission will pay the initial cost, estimated at $11,267.

Owen Sound, Ont.—T. H. Hogg and O. G. Flanaghan, Hydro-Electric engineers, have recently performed preliminary work at Eugenia Falls, and confirm the report that work will go ahead immediately.

St. Catharines, Ont.—The City Council has given final reading to a by-law providing for the expenditure of $116,000 for the establishment of a Hydro-Electric system in the city capable of supplying 2,000 h.p.

Walkerville, Ont.—The ratepayers have voted in favor of making an agreement with the Ontario Hydro-Electric Commission for a supply of power, and also voted in favor of purchasing a distributing station, sub-stations and equipment for power plant.

Morrisburg, Ont.—The corporation have entered action for the return of the power plant now supplying the Hydro-Electric Power Commission of Ontario. In 1912 it was placed in the hands of J. L. Sharkey, who was to re-open his steel sheet plant. Later it is alleged, he made an assignment of the power plant to the Rapids Co., who took it to supply the Hydro-Electric Commission with power.

Niagara Falls, Ont.—Merchants have offered to pay half the cost if the city will light the streets with lamps after the decorative illuminating system adopted in Niagara Falls, N.Y.

Chatham, Ont.—The City Council have offered the Chatham Gas Co. $190,000 for their electrical department. The company asked $192,000. If the offer is refused, a municipal plant will be erected by the Hydro-Electric Commission. Mr. Adam Beck recommends that the company be offered $410,000 for both their gas and electric plants.

Building Notes

Chatham, Ont.—The Chatham Match Co., an American concern, will erect a factory here, costing $80,000, if given certain concessions.

Toronto, Ont.—J. B. MacLean has secured permission from the city to build a five-storey brick and stone office building on the corner of University Ave. and Edward Street. It will cost $40,000.

Wood-Working

London, Ont.—The Hon. Adam Beck is contemplating the erection of a box factory at Iroquois Falls, Ont.

Dundas, Ont.—Jones Bros., makers of barbers' supplies and other furniture, will make additions to their plant.

Cumberland, B.C.—The sawmill of the Canadian Collieries Ltd., owned by Mackenzie and Mann interests, Toronto, will be rebuilt.

Port Arthur, Ont.—Heintzman & Co., piano makers, Toronto, announce that they will probably erect a plant here before long.

Burnaby, B.C.—The erection of a new shingle mill at Royal Oak, having a capacity of 60,000 shingles per day, is to be started within the next few days, according to C. C. Harrigan, manager of the concern.

General Industrial

Coquitlam, B.C.—The. B.C.. Grinnell glove factory has begun operations.

Owen Sound, Ont.—Taylor & Pringle will build a two-storey 35 x 45 ft. addition to their vinegar factory.

Toronto, Ont.—Lever Bros., makers of Sunlight soap, have secured a permit to erect a $25,000 addition to their plant on Front street.

Prince Albert, B.C.—The Scottish-American Oil & Fertilizing Co. have prepared plans for a fertilizing plant.

Guelph, Ont. — The Dominion Linen Mills Co. have asked the city to guarantee their bonds to the extent of $120,000.

Niagara Falls, Ont.—The council have promised to guarantee the bonds of a new industry to the extent of $100,000.

Sarnia, Ont.—The Imperial Oil Co. is making plans for the erection of new buildings, stills, docks, and a number of tanks.

Eureka, N.S.—The Nova Scotia Underwear Co., has increased its preferred stock by $50,000, and will instal new machinery.

Fort William, Ont.—The Armour Grain Co., of New Jersey, have taken out a license to do business in Ontario, and are expected to build an elevator here.

Woodstock, Ont.—On December 4, the Oxford Evaporator Co. plant at Currie's Crossing was destroyed by fire, with a loss of between $10,000 and $15,000.

Lethbridge, Alta.—The Royal Collieries were put up for sale by Sherriff Young on December 1. J. N. Ritchie bid $100,000, but the reserve bid was $158,000, so there was no sale.

Montreal, Que.—The Empire Cotton Mills at Welland, Ont., will be bought out by Smart Woods, Ltd. A meeting of the shareholders of the latter is called for December 22 to sanction the proposed purchase.

Vancouver, B.C.—The Cannery of the Jervis Inlet Canning Co., at Bargain Bay, 55 miles north of here, is reported destroyed by fire. The insurance is between $100,000 and $150,000. C. Cliff, Burnaby, president.

Bridgeburg, Ont.—The International Specialty Co., with capital of $200,000, will take over the Edwards-Jackson Prestoline concern, and erect a plant in the spring. Wm. G. Edwards, president, Wm. Wharton, secretary.

Brantford, Ont.—The United Rubber Mfg. & Reclaiming Co., with a capital of $350,000, have secured a site of 3½ acres and will erect a building 250 x 60 feet. A start will be made early in the new year. 100 men will be employed. R. G. Wotten, General Manager.

Ottawa, Ont.—Fixed assessment on general taxes will be granted to the United Drug Co., i.e., $15,000 for 20 years. This company is to locate a factory employing about 150 hands and costing $125,000, on Loretta and Laurel Streets and Breeze Hill Avenue.

Saskatoon, Sask.—Milling machinery costing $50,000, is being installed in the new plant of the Northland Milling Co. at Factoria. J. M. Frailich, an expert from Kansas City, is doing the work.

New Incorporations

Maloney Electric Co., of Canada, Ltd., incorporated at Ottawa, capital $300,000, to take over the business of the Canadian Maloney Electric Co., Ltd. Incorporators: Richmond W. Hart, Armand Chenier, etc., Toronto.

The Champion Brick & Tile Co., Ltd., incorporated at Toronto, capital $75,000, to manufacture and deal in brick, tile and other such product, at Kingsville, Ont. Incorporators: Darius Wigle, Reuben M. Wright, etc., Kingsville, Ont.

The Royal Motor Supply Co., Ltd., incorporated at Toronto, capital $50,000, to acquire as a going concern the business of the Royal Motor Supply Co., dealers in gasoline, oils, etc., at Toronto. Incorporators: Waldon Lawr, Vera Hughes, etc., Toronto.

Marburg Bros., Ltd., incorporated at Toronto, capital $40,000, to carry on the business of engineers, manufacturers, and dealers in all kinds of machines, machinery and appliances, movable and stationary, etc., at Toronto. Incorporators: Theodore H. Marburg, Otto Veit, etc., Toronto.

Wellington Comox Co., Ltd., incorporated at Ottawa, capital $500,000, to lay out and operate coal mines, iron mines, collieries, smelters, furnaces, mills, plant and machinery for the refining or treatment of coal and ores of every description, shops, mills and works for the manufacture, treatment or handling of coal or coke or any product or by-product thereof, at Toronto. Incorporators: Gerard Ruel, Reginald H. Montague, etc., Toronto.

Contracts Awarded

Peterboro', Ont.—The William Hamilton Co. have been awarded a contract to supply waterwheels and other machinery for a power house, by the Charlton-Englehart Power Co., Englehart, Ont.

Montreal, Que.—The Southern Counties Railway Co. have ordered six passenger coaches 55 ft. 2 ins. long, two trailer and two express cars, from the National Steel Car Co., Hamilton. The Canadian Westinghouse Co. will supply the electrical equipment. The Canadian General Electric Co. have been awarded contract for electrical equipment for the Rougemont power house.

Victoria, B.C.— The contract for the construction of the telephone line for the Sooke waterworks scheme has been awarded to Thomas Watson, whose figure of $10,650 was the lowest of the six bids received.

Victoria, B.C.—The contract for the construction of steel trestles on the Sooke Lake pipe line has been awarded by the city to the Canada North-West Steel Co., whose bid was approximately $25,000.

Ottawa, Ont.—The Government has awarded contracts for the following bridges on the I.C.R.:—The Dominion Bridge Company for four bridges—namely, over the Becancour River, over the N. T. R. bridge and bridges at Riviere Du Loup and Riviere Du Sud. The Canadian Allis Chalmers Company, three bridges at West River, Barney's River and French River, in Nova Scotia; McKinnon, Holmes & Co., bridges at Black River, Riviere Le Bras, Sayabac, Ivory Road and at Oxford Subway.

Municipal

Peelee Township, Ont.—The Council will spend $6,248 on a telephone system.

Hamilton, Ont.—The people of Mount Hamilton are raising money with which to purchase a fire engine.

East Angus, Que.—The town will spend $30,000 on the completion of its water and sewer system.

Ottawa, Ont.—The district health officer has ordered the city to enlarge or improve its incinerator.

Knowlton, Que.—The Council will engage an engineer to advise them regarding an additional water supply.

Edmonds, B.C.—A company, of which Joseph Martin, K.C., is president, is applying for a franchise to run motorbuses in Burnaby.

St. John, N.B.—The city will construct a new 36 or 48 inch main from Loch Lomond to supplement the water supply. Twenty-five new hydrants are also required.

Sault Ste Marie, Ont.—The council have decided not to go ahead with plans for their waterworks for a week or so. Steelton has decided to instal its own intake pipe.

Toronto, Ont.—A new arena costing $250,000, a machinery hall costing $175,000, and an addition to the art gallery costing $30,000, will be erected at the Exhibition Grounds.

Fredericton, N.B.—The New Brunswick Board of Fire Underwriters are urging the city to purchase a motor-driven hose wagon. The Fire and Water Committees are considering the matter.

Edmonton, Alta.—Mayor Shortt announces that another incinerator will be purchased, the steam generated being used to drive generators for supplying power to the street railway.

Sherbrooke, Que.—Provincial Government engineers are preparing plans for a highway from Sherbrooke to Stanstead, tenders for which will be called late in February, and work started as soon as the snow is gone.

Port Arthur, Ont.—A committee composed of I. L. Matthews, H. B. Dawson, and E. J. Dobie, of the Board of Trade has been appointed to determine the cost of a municipal laboratory suitable for testing material such as cement and coal.

Ottawa, Ont.—Mr. Justice Lennox recently quashed the by-law granting the city power to spend $5,000,000 on the Gatineau Lakes water scheme. The city council have now passed a by-law for the expenditure of $8,000,000.

Ottawa, Ont.—The Economical Gas, Light and Power Co. have offered to instal a gas plant here, and supply gas at 75 cents per 1,000 cubic feet, if given the right to lay pipes and instal the plant. The company was incorporated at Quebec recently, with $1,000,000 capital, to manufacture gas by the destruction of peat by a special process recently invented. The head office is in Montreal, and among the incorporators is Luigi Hoz, Italian Vice-Consul.

Refrigeration

Niagara Falls, Ont.—It is proposed to convert the new Queen Street skating rink into an ice-making plant.

Montreal, Que.—The Centerfreze Sanitary Ice Co., Merchants Bank Building, is having plans and specifications completed for its proposed 100-ton ice-making plant.

Steveston, B.C.—The B. C. Granitoid Co., who have the contract for building the new Columbia Cold Storage Co. plant, have begun work, and expect to complete the building by the spring.

Windsor, Ont.—The General Storage, Forwarding & Ice Co. has been organized by H. J. Green and others, with $200,000 preferred stock and $300,000 common stock. The company is planning to build a 5-storey warehouse, partly cold storage, and in connection a 100-ton ice-making plant.

Railways—Bridges

Hull, Que.—The Hull Electric Railway Co. will extend their line to Gatineau Point.

Peterboro', Ont.—The city is being urged to erect a bridge over the Otonabee River. The city engineer is preparing estimates.

Toronto, Ont.—Construction work on the completion of the Lake Huron and Northern Ontario Railway, formerly Bruce Mines and Algoma Railway, is now going ahead.

Quebec, Que.—It is understood among the creditors of the Charing Cross bank, now in liquidation, that the Quebec Government is considering the purchase of the Atlantic, Quebec & Western Railway, whose bonds are the bank's chief asset.

Toronto, Ont.—Frank Barber, C.E., the York Township engineer, has estimated the cost of a high level bridge over the West River at Eglington Ave., 1,000 feet long, and 100 feet above the water level, at between $150,000 and $200,000.

New Westminster, B.C.—Plans for the Government bridge over the Pitt River call for a bridge 18 feet above the river, but deputations have recently urged that it be built five feet higher to obviate the necessity of opening it for tugs.

Vancouver, B.C.—Plans are being prepared for a tunnel which the Canadian Northern Pacific Railway will build from False Creek under South Vancouver or Burnaby to the north arm of the Fraser River. The engineers are considering two routes.

Ottawa, Ont.—The London & Lake Erie Railway & Transportation Co. is applying to Parliament for an Act extending the time for construction of its authorized lines and for authority to construct branches from Sparta and from St. Thomas through Aylmer to Port Burwell.

Sarnia, Ont.—The Merchants' Mutual Line and other Lake Transportation Companies are interested in plans for a railway route through Petrolea to Corunna, with radials to Courtright, Brigden, Arkona and Sarnia. The project is backed by London and Petrolea capitalists, and options for the right-of-way have already been secured.

Montreal, Que.—The C.P.R. program for next year includes double tracking between Sudbury and Port Arthur; between Port Arthur and Calgary; between Calgary and Vancouver; between Brandon and Calgary; the double track tunnel through the Selkirks; the double tracking between Revelstoke and Vancouver; a line between Sedgewick and Edmonton, 290 miles; two new lines from Bassano to a connection with Swift Current, etc.

Trade Gossip

The Aylmer Pump & Scale Co., Aylmer, Ont., held their annual meeting on Tuesday, December 2.

Mussens, Ltd., Montreal, have been appointed sole agents in Canada and Newfoundland for Detrick & Harvey, Baltimore, Md.

U. S. Iron Production.—The production of pig iron in the United States fell from a daily average of 82,153 tons in October to 74,453 in November, according to statistics given out last week.

Work Hours Reduction.—The John Morrow Screw & Nut Co., Ingersoll, Ont., owing to the slackness of business, will cut its working week to five days of eight hours each rather than lay off any men.

The Grand Trunk Railway Co. recently purchased some shops at Elsden, near Chicago, which will be used to turn out the work that would have been done at Port Huron, Mich., had that plant not been destroyed.

Nova Scotia Steel November Output.—The output of the Nova Scotia Steel & Coal Co. for November was as follows:—Coal mined, 68,000 tons; iron ore mined, 56,436 tons; pig iron made, 6,480 tons; steel ingots, 7,750 tons; steel rolled, 8,000 tons.

Alexander Gibb, St. Nicholas Bldg., Montreal, has been appointed sole selling agent in Canada for the Vaughan & Bushnell Mfg. Co., Chicago, Ill., makers of high grade tools, such as chisels, hammers, pliers, tongs, etc. These goods are well-known to the trade, the firm having been established in 1869.

W. D. Beath & Son, Toronto, have secured the contract for an electric crane for the C.P.R. Angus shops, Montreal. They recently shipped a 3-ton, 45 ft. span electric crane to the Miramichi Fdy & Machine Co., Chatham, N.B., and a 10-ton crane to the Hydro-Electric Commission, Severn River power house.

Commemorating a Record.—J. A. Higgs, superintendent of the plant of The Steel Company of Canada at Belleville, Ont., gave a banquet on Friday, November 28, to commemorate a record made in the mills recently. Sixty were present. C. O. Jolley, mill superintendent promised a banquet when the day's output reached 100,000 lbs.

The Herbert Morris Crane & Hoist Co., Toronto, have been awarded the contract for a ½-ton hand-operated crane by the Dominion Government, to be used for handling crucibles of molten gold in the Royal Mint. Owing to the excessive heat in this department, it will be necessary to make special arrangements for the lifting gear.

Large Insurance Deal.—The largest single insurance deal ever consummated anywhere has been put through in Montreal. The policy is for upwards of $100,000,000, while the property being insured, and valued at between $112,000,000 and $115,000,000, belongs to the Canadian Pacific Railway Co. Five big insurance syndicates, among them the largest company of the kind in the British Empire, are interested in the deal.

Nine Hour Day.—The Ford Motor Co., Walkerville, Ont., has decided to inaugurate a nine-hour working day in place of the present ten-hour system. It is also part of the plan to adjust the wages in all departments in such manner that no employe will lose by reason of the reduction in time. It is estimated that the loss to the company by reason of this new arrangement will be $100 a day. A bonus system which will give all employes who have been in the service for upwards of three years a lump sum of 10 per cent. of their year's salary will also be put into effect. The plan took effect from December 1st.

Prince Rupert Publicity Campaign.—Prince Rupert, B.C., has weathered the financial gale in splendid shape, declares Mayor F. D. Pattullo. Early in the New Year the city council intends to embark on a big publicity campaign, which has been deferred until the completion of the Grand Trunk Pacific was in sight. Prince Rupert is counting on a big increase in shipping from its harbor in the next few years, for, in addition to the through traffic over the G.T.P., there is a big country to the back of the city which will provide a lot of trade and the mining and fishing industries have already assumed very large proportions.

Personal

Geo. J. Webster, Toronto, has been appointed manager of the Lake Superior Iron and Chemical Co.

W. Clement, South Vancouver, municipal engineer, and formerly Vancouver city engineer, has resigned.

George Janin, chief city engineer of Montreal, has asked leave to retire on a pension of three-quarters of his salary. The Board of Control offer a pension of half his salary.

W. D. Reid, President of the Reid-Newfoundland Co., will be in Montreal towards the end of December.

T. R. Deacon, President of the Manitoba Bridge and Iron Works, has been re-elected mayor of Winnipeg.

John Turner, of the Smart-Turner Co., Hamilton, Ont., underwent an operation for appendicitis on Sunday last.

Hon. Nanthiel Curry, president of Canadian Car and Foundry Co., visited Amherst and Halifax last week.

E. O. C. Kuhuel, president of the Standard Steel Construction Co., has moved his residence from Port Robinson to Welland.

J. H. Plummer reached Montreal Wednesday, Dec. 3, on his way to Sydney, N. S., and returned to Montreal on Wednesday, this week.

Angus Smith, late city engineer of Regina, has been appointed city engineer of Prince Albert, Sask., in place of H. Baker, resigned.

J. F. Taylor, president of the Lake Superior Corporation, has tendered his resignation as a Director of the Spanish River Pulp & Paper Mills, Ltd.

Robert Hobson, general manager of the Steel Company of Canada, was in Montreal last week on a visit of inspection to the company's plants there.

W. M. Arnold, who for the past 18 months has been purchasing agent for the Ottawa Car Co., has been appointed assistant manager, succeeding W. K. Jeffrey, who was made general manager.

A. F. Yarrow, of Yarrow & Co., shipbuilders, Glasgow, accompanied by his son, N. A. Yarrow, visited Victoria last week, after visiting Vancouver, New Westminster, and other British Columbian cities.

Edward J. Albert, district manager for Cobalt and Porcupine territory for Canadian Allis-Chalmers, Ltd., has been appointed manager of the mining department of the Company, and transferred to the head office, Toronto.

George D. Clewes, pipe expert of the Steel Company of Canada, has been under a strain recently owing to the illness of his wife, who was operated upon, but returned home this week, and is now out of danger.

Patrick Welch, of the contracting firm of Foley, Welch and Stewart, is dangerously ill in the Seattle Hospital, Vancouver. J. W. Stewart has taken his place as director of construction on the Pacific Great Eastern Railway, now under construction from Vancouver to Fort George.

A. D. Swan, formerly assistant engineer to the Harbor Commission of Montreal, has been appointed by the Dominion Government to advise on the selection of a site on the east coast of New Brunswick for the establishment of a new port.

Hon. T. W. Crothers, Minister of Labor, last week visited the plants of the Dominion Iron and Steel Co., at Sydney, N.S., and of the Nova Scotia Steel and Coal Co. at North Sydney and Sydney Mines.

Dr. John Galbraith, Dean of the Faculty of Applied Science of Toronto University, was the guest of the University Engineering Society last week-end at their annual dinner. Over five hundred were present, including some of the most distinguished engineers in the country.

Pigeon, Pigeon & Davis, Patent Solicitors, Montreal, report that 162 Canadian patents were issued for the week ending November 25th, 1913, 115 of which were granted to Americans, 20 to Canadians, 14 to residents of Great Britain and Colonies and 13 to residents of Foreign Countries. Of the Canadians who received Patents, 8 were residents of Ontario, 6 of British Columbia, 3 of Manitoba, 2 of Quebec, and 1 of Saskatchewan. In the United States for the same week, 610 Patents were issued, 11 of which were granted to Canadian inventors.

Miscellaneous

Megantic, Que. — Tenders are called until January 5, for the construction of a concrete dam in connection with a hydro-electric development for this town. E. A. Evans is engineer in charge.

Victoria, B.C.—The contract for the construction of the reinforced concrete flow line for the Sooke Lake water works system has been let to the Pacific Lock Joint Pipe Co. The company's bid was $329,760 for a forty-inch pipe line, but the size of the pipe has since been increased to forty-two inches.

Judge MacTavish heard an action in the Ottawa County Court last week, brought by Harry Lowe against the Ottawa and Hull Publishing Co. to recover payment for engineering work performed. The court was listening to an argument anent the armature, and technical terms were flying thick and fast. Still the judge did not understand, though the lawyers seemed to. At last his Lordship, thinking the subject quite irrelevant, remarked: "I hardly see what this turns on," to which Lowe retorted: "Your honor, it does not turn on anything. It projects out from the main part of the motor and does not turn on anything in particular."

Obituary

J. F. Wedlake, who for many years was engineer at the Massey-Harris plant at Brantford, Ont., died December 4.

George McFarlane, 356 Berkeley St., Toronto, who founded the McFarlane ladder works in 1872, died last Friday, aged 68.

F. W. Thomson, died at the McKellar Hospital, Fort William, from typhoid fever, on November 26, aged 63. He built the first stove foundry in Fort William, and invented some mining machinery.

Catalogues

The Smooth-On Mfg. Co., Jersey City, N.J., will send a circular dealing with their No. 7 iron cement for surfacing and stopping leaks in concrete, to any readers who are interested.

The Department of the Interior, Bureau of Mines branch, of the U. S. Government has published a technical paper No. 60, entitled "The Approximate Melting Points of Some Commercial Copper Alloys."

The Bennett-O'Connell Co., Chicago, Ill., have published a number of bulletins, neatly bound together, and dealing with the line of plating and polishing supplies which they make. The various items are illustrated and described, with sizes given in most cases.

The Bureau of Mines, Department of the Interior of the U. S. Government has published technical paper 30, entitled "Mine accident prevention at Lake Superior iron mines." In addition to the descriptive matter, the bulletin contains a number of illustrations and diagrams.

The Bureau of Mines, Department of the Interior of the U. S. Government has issued a miners' circular No. 13, entitled "Safety in Tunneling." The bulletin discusses the means of preventing accidents in driving tunnels, levels, etc., in mines and contains a number of valuable suggestions for reducing the number of fatalities.

The Department of the Interior, Bureau of Mines branch have published bulletin No. 69, dealing with coal mine accidents in the United States and Foreign Countries. The bulletin contains a number of tables giving the casualties in coal mines—for each State and for a number of years. Diagrams are also given showing the number killed and indicating the various causes.

The Vulcan Engineering Sales Company, Chicago, Ill., have sent us a copy of their new catalogue No. 51, dealing principally with the "Mumford" moulding machines. Each type is clearly illustrated and the principal features described fully. Descriptions and illustrations are given of the "Hanna" shakers, riddles, etc., and the Q.M.S. jib cranes, trolleys, hoists, etc. The catalogue also contains a list of users. Copies may be had by writing.

The Triumph Miniature Compressor is the subject dealt with in bulletin 510, recently issued by the Triumph Ice Machine Co., Cincinnati, O. The general design is described in detail, including special reference to the valves and lubrication. In addition to this, the installation features are dealt with. The illustrations are good, and special reference should be made to a sectional drawing in which every detail of the compressor is named. Diagrams with principal dimensions, are also given.

Hydraulic Valves and Fittings.—The Hydraulic Press Mfg. Co., Mount Gilead, Ohio. Catalogue No. 43. The first four pages cover the recent growth of the company and call attention to the special catalogs descriptive of the various designs of hydraulic presses and pumps which they manufacture. In the subsequent pages, the various types of hydraulic valves are handsomely illustrated and interestingly described. The valves are divided into four classes: Operating, Check, Knock-Out and Safety. A large variety of miscellaneous special valves is also shown.

The Joseph Dixon Crucible Co.—Engineers who keep a file of books for reference will be interested to know that the Joseph Dixon Crucible Co., Jersey City, N.J. still have a limited number of booklets dealing with such subjects as "Steam Traps," "Unions for Steam Pipes," "Feeding Graphite for Lubricating Purposes," etc., which will be sent free as long as the supply lasts, to anyone who cares for them. These treatises were prepared by the well-known engineer, W. H. Wakeman, who has written many articles on practical engineering problems. Numerous illustrations are used to make each subject easily understood. These booklets were printed some time ago, but are always desirable.

The Department of the Naval Service, Ottawa, has issued two bulletins, one containing tide tables for the eastern coasts of Canada and the other for the Pacific coast, both for the year 1914. In addition to the tide tables, the bulletins contain information respecting currents and special features of tides. The

A Going Concern That Is Coming

¶ In a certain city in Ontario there is located a certain manufacturing company composed of three brothers.

¶ They have been in business for themselves about nine or ten months, making special equipment for machine shops and foundries. They are making it go, and have made it go in a year that has been characterized more or less by commercial depression.

¶ Why have they been able to make good?

¶ Because they were willing to take a chance at everything that appeared to be and analized good.

¶ Perspicacity in recognizing opportunity—nerve to take a chance when they see the opportunity and ability to hustle when they decide to take the chance when they see the opportunity:—These are the qualities that have brought them a satisfying measure of success in the short time they have been in business. These are the qualities that will ultimately develop a big industry with all the attendant manifestations of success, such as a healthy balance in the bank, bird's eye views of a big plant, limousine outside the main office door, biography in ''Canadian Machinery,'' etc.

¶ The other day this concern placed with us an advertising contract for one year—practically without solicitation.

¶ The idea was simply placed before them. It looked good. It looked good because it was good, but they had the ability to see and realize that it was good. Therein they differed from some firms we have endeavored to interest.

¶ ''We know from our own experience that advertising makes sales even if it never gets an inquiry. We ourselves read the advertising pages and have been influenced in buying our equipment at various times. You don't need to tell us advertising is good—we know it. In a month's time we'll be with you.''

¶ The point we want to make is, that this concern—this going concern—this coming concern—is now advertising because the men at the head of the concern have read and do read advertisements, and have bought advertised equipped.

¶ Which would go to show, we think, that it pays to read the ads. and buy advertised goods, and, finally, that **It Pays To Advertise.**

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.
143 University Avenue, TORONTO

Give Your Friends This Handsome Xmas Gift

It gives pleasure the whole year round and is a constant source of delight, instruction and interest.

All the anxiety and trouble of searching for a valuable and appropriate gift for our friends is simply overcome by giving them a year's subscription of MacLean's Magazine—*Canada's National Monthly Magazine for the business, professional man and his family.*

This makes a gift that is not soon forgotten like an ordinary gift is apt to be—The coming of this distinctive Canadian Magazine each month will recall your graciousness throughout the whole year.

Send in the name or names of your friends with $2.00 for a year's subscription and we will forward them the January issue—the first of the strong one's that will follow each month—The January copies will be ready for mailing on the 15th of December, and will reach your friends amid the Yule-tide Festivities.

The excellent nature of the subjects contained each month will be noted from these features which appear in January:—

CHARMING CHARACTER SKETCHES.

Each Issue portrays one or more snappy articles on Men of to-day.

MEN AROUND THE KAISER.

F. W. Wile's German sketches continue in Each Issue.

MONEY AND AFFAIRS.

Jno. Appleton, Associate-Editor, Financial Post analyses each month the financial outlook.

BEST BOOK OF THE MONTH.

Findlay I. Weaver, Editor Bookseller and Stationer, gives a racy account of successful books and authors.

THE UNUSUAL IN CANADA.

Always Some Interesting Articles on Other Topics.

SHORT STORIES AND SERIALS.

From 4 to 6 Best Short Stories and a laughable serial in each issue.

REVIEW OF REVIEWS.

Herein the Busy Reader can have the Best from Current Magazines condensed for him. This Feature excels in Interest.

Altogether don't you think that this is the Biggest Gift that you can give your friend. Try it.

Send the names of your friends in to-day to catch the early Christmas mail.

The MacLean Publishing Co., Ltd.
143 University Avenue, Toronto, Ont.

bulletins will be mailed free, on application to the Government Printing Bureau, Ottawa.

The Gilbert & Barker Mfg. Co., Springfield, Mass., have sent us a catalog dealing with their process for burning fuel oil under low pressure. The merits of oil are discussed in comparison with other fuels, and reference is made to its various uses. A description of the apparatus is given with illustrations of various burners and several installations. The catalog also contains a number of testimonials and a partial list of users of the apparatus.

The Canadian General Electric Co., Ltd., have issued bulletin No. 4966A entitled Hydro-Electric Power developments. The bulletin deals with various large hydro-electric installations made by the company giving illustrations and principal details of each. The descriptive matter deals fully with the equipment installed and the transmission lines in connection, together with illustrations. The bulletin concludes with a partial list of plants where this company's equipment is installed. Copies of this bulletin may be had by writing.

Lunkenheimer regrinding valves are fully dealt with in a booklet which the Lunkenheimer Co., Cincinnati, O., have recently published. A comprehensive description is given of this valve together with a descriptive view showing how it is possible to regrind the valve seat without disconnecting the pipes. The booklet contains price list for complete valves and parts, also diagrams of the various types in connection with which are tables giving leading dimensions of the different sizes made by the company. Copies of this booklet may be had on request.

H. Mueller Co., Ltd., Sarnia, Ont., and Decatur, Ill., have published a new or third edition of the catalog "D" which deals fully with the complete line of plumbers' supplies, gas and water fittings which they make. One special fea-

FOR SALE—TWO USED 16 IN. x 6 FT. CINCINNATI engine lathes, now operating in our shop. Write for details and prices, subject to immediate acceptance. The Cincinnati Lathe & Tool Co., Oakley, Cincinnati, Ohio. (24)

MACHINERY FOR SALE—NEW AND SECOND-HAND machinery, engines, boilers, wood and iron working machinery and supplies. Write, stating what you require. Prompt and careful attention to all inquiries. The Advance Machine Works Co., Montreal, Que.

FOR SALE—CANADIAN PATENT RIGHTS of combination scrubbing and mopping machine. Scrubs, mops and cleans in one process, very rapidly, efficiently and economically. Will sell readily to all places having large floor area. Any motor will operate it. This machine's practicability has been thoroughly tested and large profits will follow its manufacture. Inventor owns patents (Nos. 140547 and 144918), and will furnish plans and photographs to any responsible person interested. Address Alfred Best, Templeton Building, Salt Lake, Utah. (24)

ture to be noted is the sectional thumb index, a key to which is given on the outside front cover. A complete buyers' index is included where the plate numbers are arranged in consecutive order with section and page numbers given. There is also a general index and a complete telegraph code. The catalog is fully illustrated and descriptions of different supplies are given where necessary. The Mueller machines for drilling and tapping mains under pressure are illustrated and described in detail. The catalog is an exceedingly handsome production being printed on fine India paper well bound, in cloth covers. It should be in the hands of all buyers of plumbers' supplies. The company will be glad to send a copy in reply to genuine enquirers.

Book Reviews

"**The Strength of I-Beams in Flexure,**" by Herbert F. Moore, has just been issued as Bulletin No. 68 by the Engineering Experiment Station of the University of Illinois. The formulas commonly used by architects and structural engineers for determining the load-carrying capacity of structural steel shapes are, in general, based on the common theory of elasticity and the tensile strength of structural steel. In figuring the strength of I-beams under transverse loads, it is the usual practice to consider only the direct flexural action. Transverse tests of I-beams have not been numerous, and the results of such tests have not been widely used. It is known that besides direct flexural action in an I-beam there are also sidewise buckling action and stresses in the web. In this bulletin these secondary effects are discussed, and tabulated summaries given of the results of tests of I-beams at Illinois and elsewhere. From the results of tests the conclusion is drawn that in considering direct flexural action of I-beams, the yield-point strength of the material must be regarded as the ultimate fibre stress for the beam. From the results of tests, proposed formulas for strength against sidewise buckling and for strength against web failure are deduced. Copies of Bulletin No. 68 may be obtained upon application to C. R. Richards, Acting Director of the Engineering Experiment Station.

No User of Ball Bearings Can Afford to Neglect These Points

1 **Double Row of Balls**—virtually two bearings in one—a splendid feature under any load condition.

2 **Pressed Retainer in One Piece**—made from Swedish Lancashire Iron. No rivets, wires or screws to work loose, jam balls, disarrange spacing or make noise.

3 **Outer Race Spherical**—providing for a frictionless self-alignment that absolutely and automatically compensates for shaft spring.

4 **Best Swedish Crucible Steel**—Carefully heat-treated and uniform in hardness throughout. Unequalled for toughness, carrying capacity, accuracy and durability.

SKEFKO

is the only truly self-aligning bearing. This feature alone is worth most careful consideration.

SKEFKO Self-Aligning Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

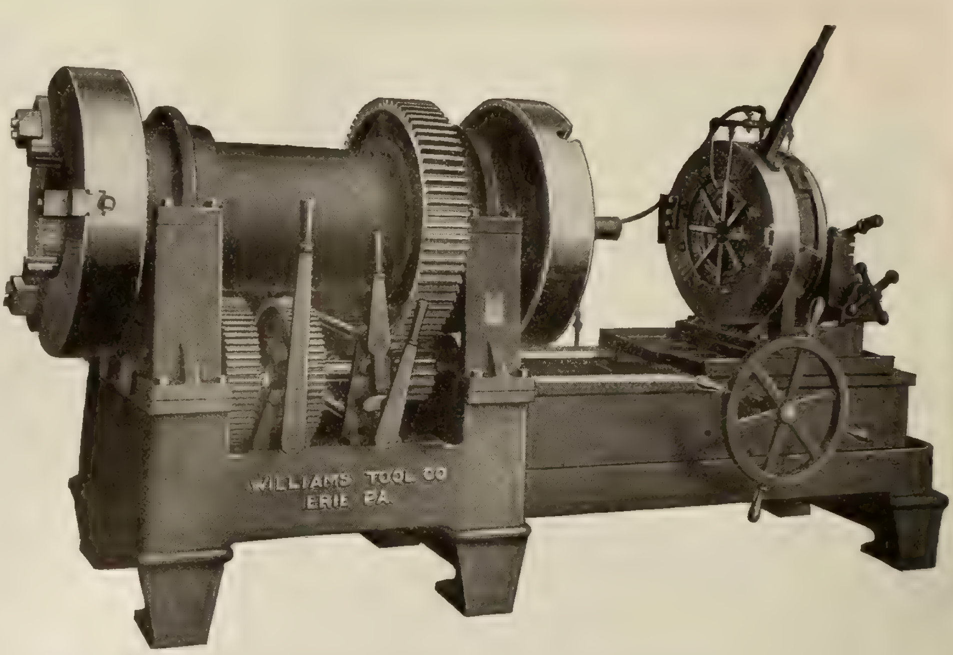
¶ A Pipe Machine might be built that outwardly would resemble the Williams. But it would be a difficult matter to equal the superior quality and efficiency of the Williams Machine. These represent years of patient experiment with various metals and hardening steel.

¶ It is simply astonishing how slight a variation in the degree of hardness or angle of clearance seriously affects the cutting and lasting quality of pipe machine dies.

¶ Why take chances? *Why not have the machine that has been tried and tested in 1,500 shops and not found wanting?*



Drop us a line stating capacity of machine in which you are interested.

WILLIAMS TOOL CO., Erie, Pa., U.S.A.

SOLD BY THE

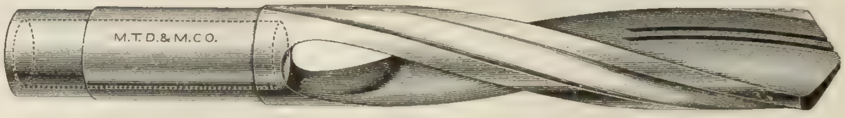
A. R. WILLIAMS MACHINERY COMPANY

TORONTO WINNIPEG VANCOUVER

FOR DEEP DRILLING OR LONG HOLES USE

HOLLOW DRILLS

"MORSE" MAKE



These drills are very much in demand. They have no equal for the kind of work for which they are made. Our catalogue shows an outline drawing of the manner in which they are used, also a full description of the drills themselves. It shows also various kinds of Oil Drills, Three and Four-Groove Drills, Shell Drills, and a large number of other styles.

Send for a copy—free.

Morse Twist Drill & Machine Co.

NEW BEDFORD, MASS., U.S.A.

"Morse" Drills and Tools are handled by:—Rice Lewis & Sons, Limited, Toronto; Aikenhead Hardware, Limited, Toronto; Frothingham & Workman, Montreal; Mechanics Supply Co., Quebec.

CANADIAN MACHINERY BUYERS' DIRECTORY

TO OUR READERS—Use this directory when seeking to buy any machinery or power equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A rate of $5 per line a year is charged non-advertisers.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

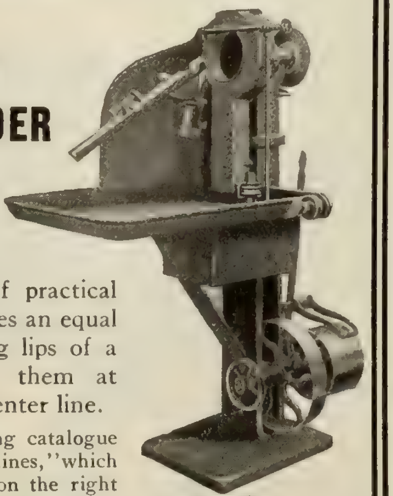
The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

A CORRECT CUTTING EDGE

is indispensible on Twist Drills which are to be used for the performance of rapid and accurate drilling.

THE AMERICAN DRILL GRINDER



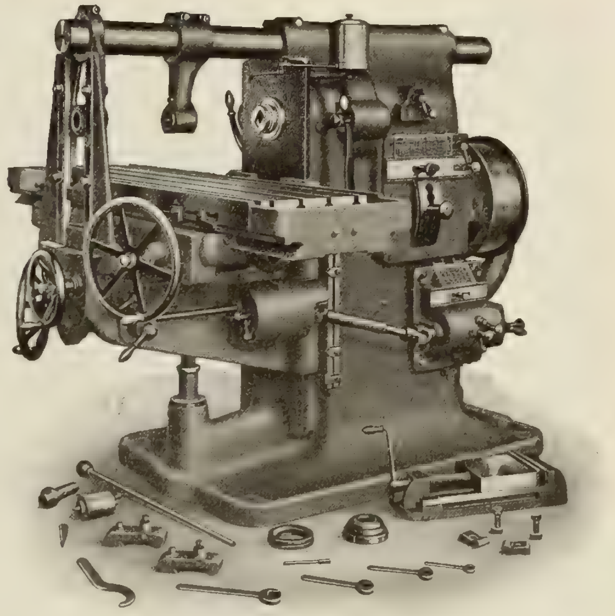
is built along scientific and mechanically correct lines, which have been determined by many years of practical experience. It insures an equal length to the cutting lips of a drill and will grind them at equal angles to the center line.

. We have an interesting catalogue on "Drill Grinding Machines," which contains valuable data on the right and wrong methods of grinding drills, It's yours for the asking. May we not send you a copy?

WRITE NOW.

THE HEALD MACHINE COMPANY

8 NEW BOND STREET, - WORCESTER, MASS.
Chicago Office - 24 South Jefferson Street



Meets Requirements For Heavy Service

What do you expect in any machine designed for heavy manufacturing service?

Above all, ample power and a consistently rigid design.

Note how well these points have been taken care of in the No. 5B Heavy Plain Milling Machine.

Large diameter constant speed drive pulley running at high speed carries an extra wide belt. The over-head pulley is also of large diameter, giving wide belt contact and powerful driving leverage. The variable feed, by means of hardened spur gears, is driven by chain direct, mounted on large diameter hardened steel shafts, firmly supported. Result,—elimination of vibration and maximum efficiency.

The knee slide extends to the top of the frame, stiffening the column and forming a massive housing for the spindle. Notice the long bearing of the knee on the column. Stout transverse ribs give rigidity for heavy service.

The table is heavy and has a vertical depth that gives the necessary stiffness to prevent springing under deep cuts. The depth of the saddle and extra long bearings in proportion to the length of the table are clearly shown.

Stout, easily adjustable braces serve to firmly lock the knee and overhanging arm together, resisting the stresses that tend to produce vibration.

If you have heavy milling, these features should interest you.

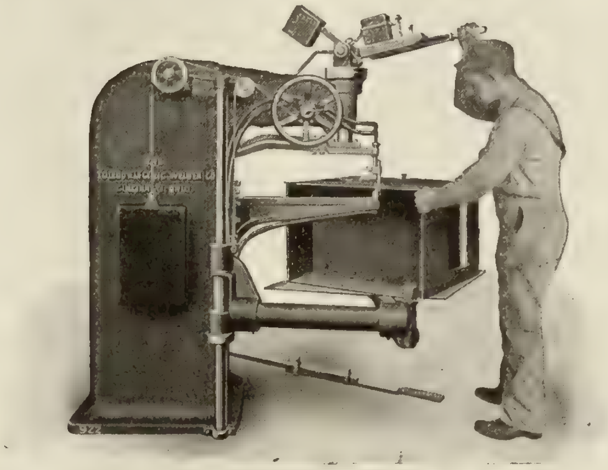
Costs 250% More to RIVET Than to SPOT WELD



This boy is
Welding
Stove Bodies

He does more
work than NINE
RIVETERS
can do

LABOR COSTS REDUCED FROM 60 TO 95%

There is hardly a riveting job that cannot be done more cheaply and better the electric way—the "TOLEDO" way. Try a "TOLEDO" for 30 days. If it doesn't save money for you—you don't want it; ship it back. **That** shows **our** confidence in "TOLEDO" welders. Send us samples of the work you want to do. We will weld them free of charge, return them to you, and tell you what you can save.

Bulletin No. 15 tells about spot welders. **Bulletin No. 14 about butt welders.**

NO LEASE. NO LICENSE. NO ROYALTY.

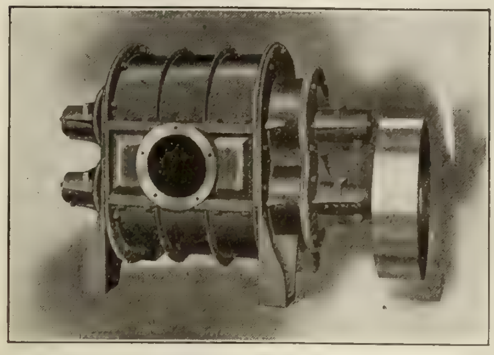
BLOWERS



ROTARY POSITIVE PRESSURE TYPE

Weighs less and occupies less space for the same displacement per revolution than any other two-impeller blower.

LET US KNOW YOUR REQUIREMENTS

CORRESPONDENCE A PLEASURE

Sherbrooke Machinery Co.,
LIMITED
SHERBROOKE, QUE.

BLOWER DEPT:

CASTINGS

DIE CASTINGS

Gas engine bearings, particularly the agricultural type, can be fitted with die cast bearings at a minimum expense, with the maximum efficiency in wear and ease of adjustment and replacement. An accuracy of .001 in. can be maintained.

Special booklet sent upon request.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand Rammer in operation.

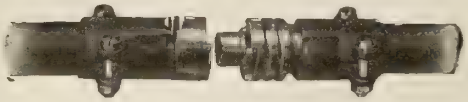
CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.



Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock: — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

CLEVELAND PNEUMATIC TOOL CO. OF CANADA, LIMITED
80 DUCHESS STREET, TORONTO, ONT.
Agents: A. R. WILLIAMS MACHINERY CO., TORONTO. WILLIAMS & WILSON, MONTREAL.

Don't Be a Commercial Explorer

¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable,* and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS—Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS—Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS—A nominal rate of $5 per line a year is charged non-advertisers.

Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

Tools of Quality
W&B
Bear These Marks.

You Can Get All Your Machines Can Give—with "W & B" Reamers

Tools of Quality
W & B CO
Bear These Marks.

Are your machines being handicapped by the poor quality of your tools?

It wouldn't be a bad idea to check up your reamer jobs with a view to finding out whether your machines are working at full capacity.

If a machine can be made to produce more and better work by simply changing the tool equipment, why not change to full capacity tools—for reamer jobs the tools are "W & B" Reamers.

A good start in the right direction will be to give "W & B" Reamers a trial test.

Go to your jobber for "W & B" Reamers. If he hasn't a full supply, send order direct.

CANADIAN MACHINERY AND MANUFACTURING NEWS

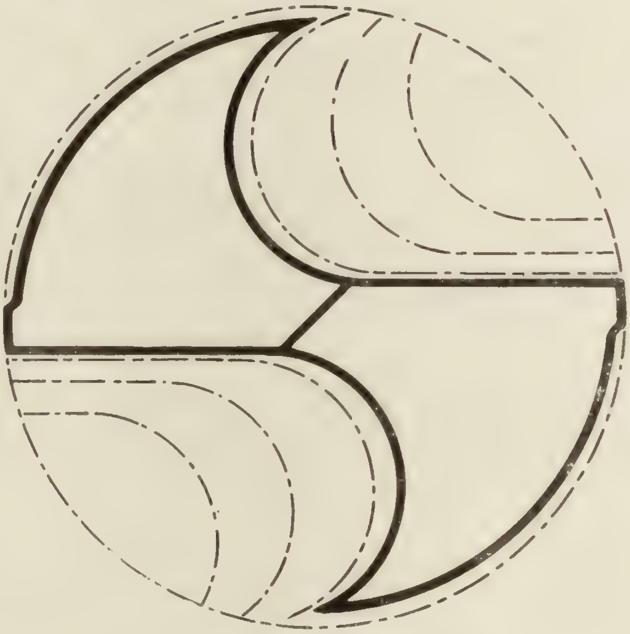
A weekly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields, Published by the MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg and London, Eng.

MONTREAL, Eastern Townships Bank Bldg. TORONTO, 143-149 University Ave. WINNIPEG, 34 Royal Bank Bldg. LONDON, ENG., 88 Fleet St., E.C.

Vol. X Publication Office: Toronto, December 18, 1913 No. 25

Note the Contour of the Grooves

This is a head-on view of a **Wilt Twist Drill** showing the successive steps in its manufacture all made at a single chucking.



The dotted lines show the three roughing cuts and the finishing cut that takes off the last fifteen thousandths of an inch and gives the drill its final scientifically accurate contour.

Then before the drill is released from chucking the relieving cut is taken and the clean well defined clearance is produced.

Wilt Twist Drills are made by a process that marks the most revolutionary progress that has been made in the manufacture of **Twist Drills** in a quarter of century.

If your regular supply man does not handle Wilt Twist Drills, write direct—we want you to try them.

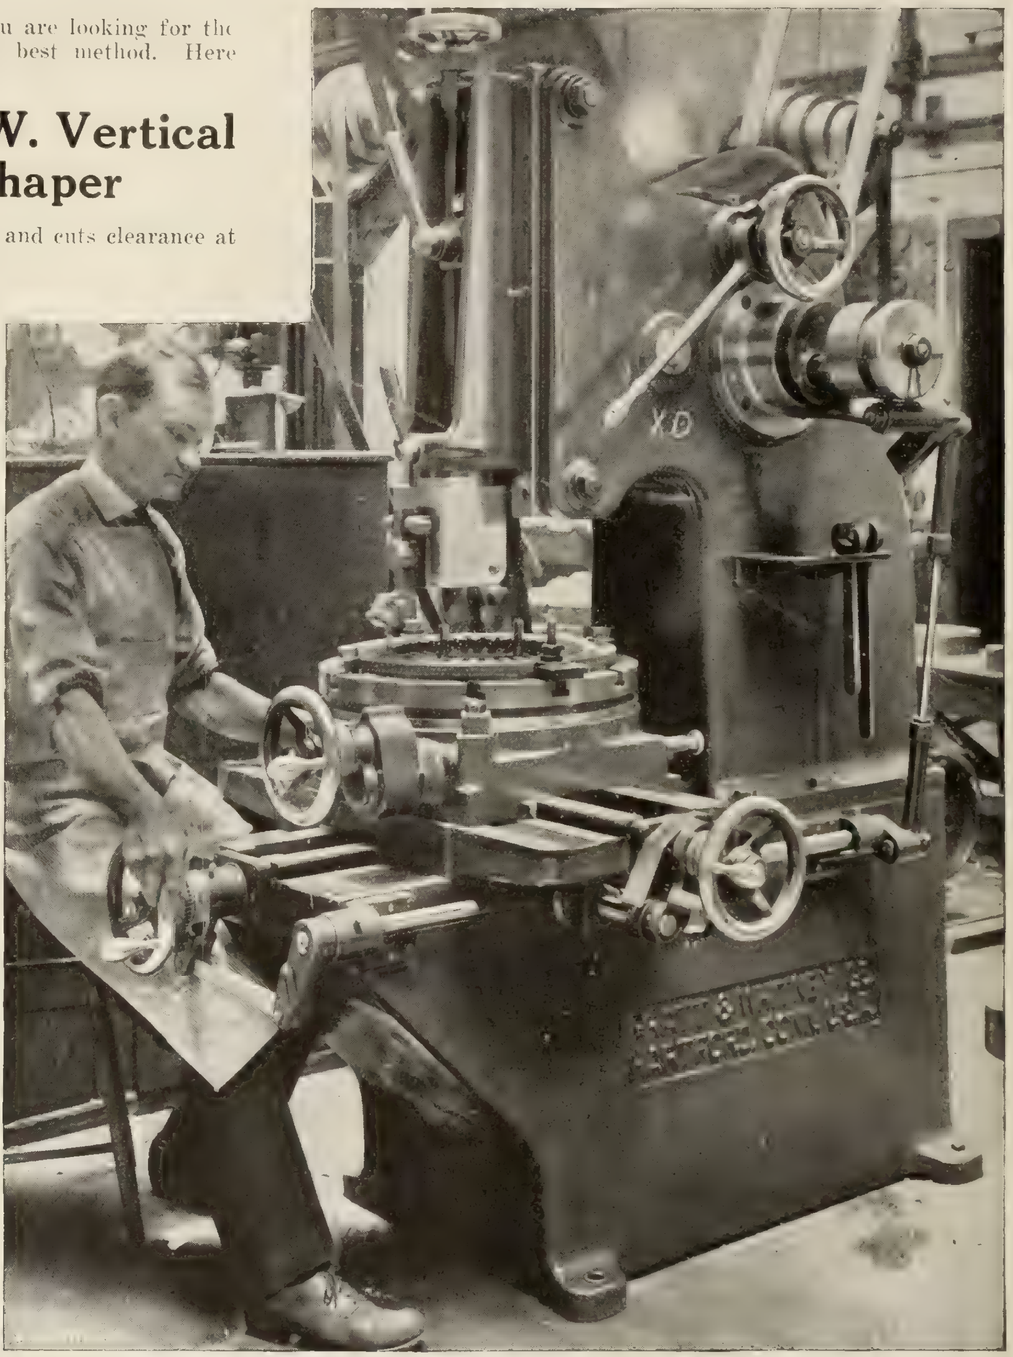
The Wilt Twist Drill Company of Canada, Limited
Walkerville, Ontario.

HOW ARE YOU MACHINING YOUR PUNCHING AND TRIMMING DIES?

Of course you are looking for the cheapest and best method. Here it is:

P. & W. Vertical Shaper

machines die and cuts clearance at same setting.



Showing P. & W. Vertical Shaper at Work on Punching Die for Armature Laminations.

The P. & W. Vertical Shaper is especially adapted for finishing punching and trimming dies. The ram bearing can be tilted, permitting the tool to cut at an angle from the vertical. Hence the desired clearance can be readily obtained.

Another advantage of the Vertical Shaper on die work is that when working to a line the cutting tool always enters the work where the line is scratched. Thus the line can be accurately followed. Convenient means are provided for indexing the table.

Write for illustrated circular and any further information desired.

Instantaneous Self-Alignment

The key to successful bearing operation is instantaneous and frictionless self-alignment. There is one famous make of ball bearings that possesses this all important feature—SKEFKO.

This instant adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary ball bearings, as they are frequently mounted in swivelling housings. The advantage of having this feature inherent in the bearings themselves, as in Skefko Bearings, is obvious, for the swivelling takes place on balls instead of on a solid bearing.

SKEFKO

"Self-Aligning Ball Bearings"

Eliminate friction, reduce wear, obviate repairs, increase the life of machines, require a minimum of attenton and cut down maintenance cost.

Skefko Self-Aligning Double Row, Double Capacity, Double-Life Ball Bearings cost no more than ordinary bearings, and are made in international standard sizes. Their use is practical under any load and speed condition.

We can show you where Skefko Ball Bearings will save power, attention and lubrication, and simultaneously increase your output and improve the quality of your work.

Your best interests demand that you investigate. Ask us for "Skefko Bulletins."

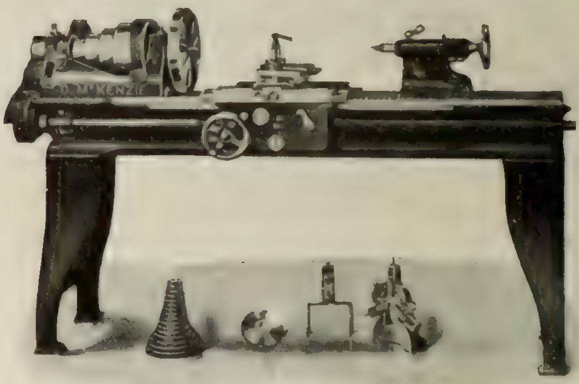
When you're Buying
Buffing Machinery

consider the Blount No. 3. Note the rigid design, the ample self-oiling bearings, the length of spindle that allows two men to work in comfort, at once.

The "Blount" is honest buffing machine value. It is made in a factory where special tools, modern methods, and the best of materials allow us to produce a high grade machine at a reasonable price.

Write for further particulars.

J. G. BLOUNT CO.
Everett, Mass., U.S.A.



"McKenzie" Engine Lathes

represent real engine lathe value.

Their rigid design and the excellence of their materials and workmanship appeal to the man who needs a lathe that will give efficient, accurate service for many years.

Let us send you full specifications.

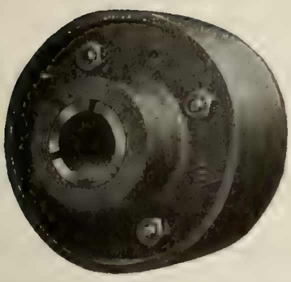
D. McKenzie, Guelph, Ont.

SHAFTING COUPLINGS

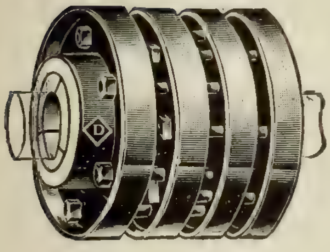
Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

Everything for the Mechanical Transmission of Power

TORONTO **MONTREAL**

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 19—The Vertical Miller

The vertical miller construction in which both spindle and knee are adjustable is a relic of the days when a milling cutter was regarded as scarcely more than a coarse file and when machines were light and delicate.

In these days of heavy work on vertical millers this duplication of adjustment is detrimental to the rigidity of the machine as well as unnecessary.

For this reason we build Milwaukee Vertical Millers with adjustable knee and with spindle that is adjustable only to wear. This construction is decidedly rigid and can be relied upon to maintain correct alignment through many years of service.

Adjustment sufficient for all practical purposes can be secured by adjusting the knee alone. The adjustable knee is much better suited to withstanding the cutting strains than an adjustable head would be.

In other respects the Milwaukee Vertical Miller embodies the same excellent features of construction as the Plain, Manufacturing and Universal types. This includes:—constant speed drive, cascade lubrication, flanged spindle, etc.

The cascade lubrication system is extended so as to keep the gears and bearings in the spindle head also cool and free from dirt or other foreign matter. A cupped collar on the spindle sets in a collar in the frame and prevents oil overflowing the end of the spindle.

The "WHYS" in favor of Milwaukee Millers cover Vertical, Plain, Manufacturing and Universal types. They are intensely interesting to all milling machine users. You get them by writing for our Bulletins.

Speeding up Micrometer Measurements!

Every shop in the country is devoting time to the question of increasing the speed of production. Each process is timed and analyzed to eliminate unnecessary operations. Here's a suggestion to efficiency experts who superintend men making frequent measurements. Provide each man with a

STARRETT
Quick Adjusting Micrometer

and see how much quicker he will turn out the work and how much better satisfied you will be with it.

This micrometer embodies one of the finest improvements to an instrument of precision that has ever been made. In the handle is a plunger which under slight pressure from the finger releases the nut on the micrometer screw and permits the spindle to *slide* to its adjustment. The plunger may then be released and the final accurate adjustment made as usual.

Simple, isn't it? Well, we have lots of Starrett tools that can accomplish just such results in their line. We want every man who is interested in time-saving on measuring operations to get in touch with us.

Let us send you catalogue 203 which describes the full Starrett line.

The
L. S. Starrett
Company
Athol, Mass.

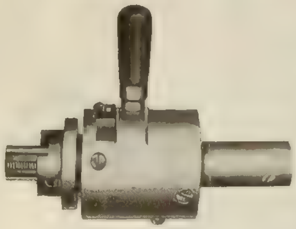
Take 'em on Trial Prove it Yourself



THESE "M.E.C." COLLAPSIBLE TAPS increase production—increase it on any machine on which they are used.

If you use taps, you are interested in this fact. You *must* be interested.

It is not hard to tell you *why* "M.E.C." COLLAPSIBLE TAPS increase production, but we prefer a shorter, surer method than this:—

We want to send you the taps you need for a *30-DAY FREE TRIAL. That* will prove it beyond any question of a doubt.

We are also builders of

AERO Chucks and Special Tools

for brass and iron.

Permit us to mail you a copy of the LABOR-SAVING DEVICES catalog.

Manufacturers Equipment Co.
169 N. Jefferson Street, Chicago, Ill., U.S.A.

Geometric Screw-Cutting Die Heads Lead

They are in general use on Screw Machines and Turret Lathes.

Employed in cutting right and left-hand threads of standard or special pitch; also various special forms, such as the Acme, Metric, etc., as well as standard pipe threads.

The chasers are opened automatically, and there is no running back over the work after the thread is cut.

Geometric Die Heads

Can be furnished for cutting any size thread from the smallest screw up to the greatest diameter required.

Tell us your requirements, and we will recommend the Die Head.

All Civilizations are Built on Business—And Each Business Man is Building a Monument to the Age in Which He Lives.

The curtain of civilization—so far as our knowledge runs—lifts on the shifting scenes of industries promoted by tyrant kings and carried out by hordes of slaves. Business as we understand the term to-day—and so far as records run—had its beginning somewhere along the coast of Phoenicia, which was a little strip of land about 150 miles long and about 50 miles wide.

The comparatively few people who lived and worked along this little strip of land controlled the industrial markets and the marine business of the entire civilized world. This perhaps is the most magnificent and the most extraordinary illustration of the influence of business in building a nation, that the world has ever seen.

During the Middle Ages the word "business" was used as an epithet in order to discredit a man, or to belittle him. To speak of a man in those days as being "engaged in business," as "carrying on trade," or as being "concerned in the market," meant to ostracize him socially. A man who then worked at a certain trade or performed a certain service was beneath the notice of the leisure classes that lived from the labor of slaves and powdered flunkies; in other words, the classes which represented the accumulated wealth and accumulated influence of the state or nation.

It seems peculiar to the modern mind that there should have been a period of time when this attitude or this conception of service and usefulness existed. A country or a people has prospered, has made history always in times of peace; when the conduct of business has not been interrupted nor interferred with by the tyranny of government, or by the disasters of war. Nations which are constantly carrying on war within themselves, or with other nations, do not have time to build up business intercourse—business institutions; do not have time to exchange commodities, products and values with other nations.

The history of the Old Testament is a continuous recitation and rehearsal of bloody wars among tribes and among nations during which no business of any consequence was carried on and during which no advancement was possible. In the tropical zones men do little else than carry on strife, political and religious wars; or wars conducted by bands of rebels who insist that they will never submit to law or government.

The truth that stands out against this background of facts is that every modern town is a business town, that the most influential and most important individual in the world today—and during all the days there have ever been, is the man who has rendered some useful service. There has been a tendency and is even yet, to pay tribute to writers, poets, artists, teachers, who oftentimes are little more than idlers. Alexander von Humboldt, author of "The Cosmos," tells us that in the very beginning of the history of China—so far as records run—people gathered in beautiful gardens, overlooking the harbors of great cities, to watch incoming ships loaded with perfumes, spices, merchandise, rich fabrics and oils,—and bringing news and information from every part of the known world. This was the "Golden Age of China."

Travellers and scientists have shown us, beyond any question, that long before recorded history began, there were in China well-travelled roads used as highways of commerce, which for centuries have been buried beneath vast beds of drifting sands. Along these highways of business there were beautiful lakes, artificial canals, parks, groves of trees, hamlets, towns and cities; and people hurried back and forth about their business—exchanging ideas and carrying on commerce between themselves.

During the last twenty years, and more particularly during the last ten years we have, to a very great degree, combined business, religion, poetry and literature—all into an "Age of Common Sense." If you conduct a shop, a store, or a factory, you are assisting to build a monument to the Age in which you have lived—to the business fabric of your time;—if this shop, or factory, or store is conducted along the lines of highest and greatest intelligence and efficiency.

Efficiency

INDUSTRIAL NOTABILITIES--No. 13

It is often shocking to engineers to learn that the men at the head of some of the largest steel corporations are not engineers by profession. Many are accustomed to think of J. H. Plummer, who has been so much before the public eye of late in connection with the financing of the Dominion Iron and Steel Corporation, as one who has been through the mill and knows the steel business from A to Z. Such is not the case. The very business on which Mr. Plummer has been engaged of late shows the need of a man at the head of a concern like this who is a financier. Robert E. Harris is not a financier by profession, but a lawyer. He looks after the affairs of the Nova Scotia Steel and Coal Co. as president, and leaves the operation of the mills to one who does know the steel business —to Thomas Cantley. As president of this big steel corporation, Mr. R. E. Harris, K.C., is entitled to a place among industrial notabilities.

Robert E. Harris, K.C., D.C.L., was born August 18th, 1860, at Annapolis, N.S., son of Robert J. and Rebecca (Ditmars) Harris. His paternal ancestors were English, maternal were Dutch. He received his early education in the common schools of his native place and from private tutors. He became a law student in 1878, with J. M. Owen, barrister, Annapolis. At a later period he entered the office of Thompson and Graham (Right Hon. Sir J. D. S. Thompson and Hon. Mr. Justice Graham) In 1882 Mr. Harris was called to the Bar, and in 1889, when under 30 years of age, he was made a K.C., being one of the youngest men in Canada to take silk. He practiced his profession ten years at Yarmouth, N.S., and then moved to Halifax, where he joined the firm of Henry and Henry, the new firm being known as Henry, Harris and Henry. One year later the Hon. Hugh McD. Henry went on the Bench, and the firm continued under the title of Harris and Henry, Mr. Harris becoming senior partner. By the admission or retirement of other partners the firm's name was changed to Harris, Henry and Cahan; later to Harris, Lovett, Henry and Stairs, then to Harris, Henry, Rogers and Harris. Mr. Harris still continues as the head of the firm.

ROBERT E. HARRIS.

Shortly after his removal to Halifax he became a member of the Council of the Nova Scotia Barristers Society, and was later elected Vice-President and President, holding the latter office several terms. He is one of the leading practitioners in Canada, and has held briefs in many of the Canadian courts. In 1905 the degree of D.C.L. was conferred upon him by King's College, Windsor, N.S., of which institution he was for a long time a governor. He at present holds important offices: President of the Nova Scotia Steel & Coal Co., Ltd.; President of the Eastern Trust Co., President of the Elgin & Havelock Railway Co. He is a director of the following: Bank of Nova Scotia, Maritime Telegraph & Telephone Co., Acadia Sugar Refining Co., Trinidad Electric Co., Camaguey Electric Co., Demerara Electric Co., Eastern Car Co., and a number of other companies. Mr. Harris is also a Director of the School for the Blind at Halifax, one of the leading institutions of its character in the world.

He is a member of the Halifax Club of Halifax, and of the Mt. Royal Club of Montreal. Mr. Harris was married in June, 1883, to Minnie L. Horsfall, a daughter of James Horsfall, of Annapolis, N.S.

Determining the Cutting Power of Lathe Turning Tools

By William Ripper, D. Eng. D.Sc. and G. W. Burley **

The question of the definite measure of the output of work, or of the removal of material, of which lathe-tools are capable, is one about which there is very little information readily available; and it was for the purpose of determining the behavior of cutting tools over a fairly wide series of working conditions, and of deducing therefrom some practical results, that the experiments here detailed were undertaken.

THE high-speed steel tools which were put under test were made from ¾-inch by ½-inch bars, as in the case of the carbon-steel tools, the tools being made about 8 inches in length. The shape of nose adopted for the first set of tests was that used for the corresponding ordinary carbon-steel tool tests, and as illustrated in Fig. 1 page. The tools were made of a high grade of high-speed steel, shaped entirely by grinding in a universal tool grinder—thus dispensing with the necessity of forging—and then hardened according to the directions of the maker. This size and shape of tool were adopted so that the tests would be comparable with those made on the carbon-steel tools.

A further series of tests have since been made to determine the relative effects of area of tool steel section upon the possible output, as measured by the relative areas of cut which the tools would respectively take, the conditions as to cutting speed being similar, and a series of factors obtained, so that when the output with the given section is known, the output with a tool of any other required section may be obtained by the aid of a factor.

The Test Lathe.

The tests were made on the large electrically-driven experimental tool testing lathe—18-inch centres, installed in the machine-tool laboratory of the University of Sheffield, and described later.

Fig. 24

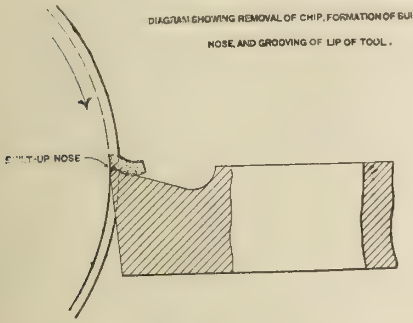

DIAGRAM SHOWING REMOVAL OF CHIP, FORMATION OF BUILT-UP NOSE, AND GROOVING OF LIP OF TOOL.

The Test Bars.

The test bars used were three in number and of different chemical compositions and physical properties. Their approximate original dimensions were:—

Length = 9 feet 6 inches.
Diameter = 1 foot 8 inches.

Fig. 26.

CUTTING SPEED AND DURATION TESTS FOR VARYING AREAS OF CUT.
HIGH-SPEED TOOLS ON MEDIUM STEEL.

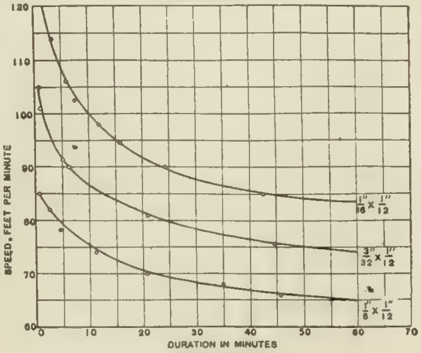

Fig. 27.

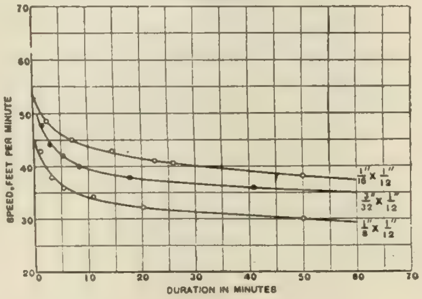
CUTTING SPEED AND DURATION TESTS FOR VARYING AREAS OF CUT.
HIGH-SPEED TOOLS ON HARD STEEL.



Their identification letters are A, B, and C, bar A being mild steel, bar B medium steel, and bar C hard steel. Two of the bars, the mild steel and medium steel bars, were parts of propeller shafts of dismantled ships. The hard bar was especially cast, forged, and annealed for the purpose of the tests. Test pieces were cut from each end of the respective bars and tested. The bars were found to be practically of uniform quality throughout.

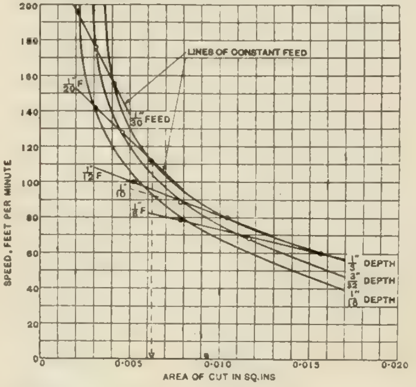
RELATION BETWEEN CUTTING SPEED AND AREA OF CUT FOR VARYING CONDITIONS OF DEPTH AND FEED.
HIGH-SPEED TOOLS.



Breaking-down Point of Tool.

With the high-speed steel tools it was not necessary to submit the cutting edges of the tools to microscopic examination, as it was found possible to obtain a definite point at which the tool failed to cut, or broke down. This is the point at which the working cutting edge collapses, and, instead of continuing to cut, causes the surface of the bar to become highly polished. The exact instant at which each tool broke down or began to produce this polished surface was observed, and from this the exact duration of the test was determined.

Standard Duration of Test.

In these tests a standard life of tool of 60 minutes was selected as being a convenient value. It is true that in machine shops, high-speed tools are usually allowed to run for a much longer period than this before re-sharpening, and the curves of performance seem to suggest that this practice has a reasonable basis, since the cutting speed which corresponds to a life of 60 minutes is in practically every case but about 5 or 10 per cent. greater than that which will allow a tool to last for, say, three or four hours.

---

*Part II. of a paper read recently before the Institution of Mechanical Engineers.

**Dean of the Faculty of Applied Science and of the Staff, respectively, of Sheffield University.

The failure of a high-speed turning-tool working under normal conditions is, in most cases, brought about by the fusing of the nose due to the heat generated as the result of friction. The friction is due:

(1)—To the rubbing of the chip on the upper lip of the tool as it passes off from the work, Fig. 24. This rubbing action frequently causes a pit or hollow to be worn out of the upper face or lip of the tool just in front of the cutting edge as shown in the Figure.

(2)—To the friction due to the cutting action of the tool as it traverses the work in a line parallel to the axis. When the tool is worked under conditions which are not excessively severe, the heat generated at the nose of the tool is conducted away as fast as it is generated, and thus the nose is not subjected to over-heating; but if the conditions of speed of cutting and of area of cut are such as to generate heating of the nose faster than the tool can conduct it away, fusing and breakdown at the nose takes place.

Also, as the work proceeds, the tool accumulates heat from the nose backwards, and the rate of flow or conduction of the heat away from the nose correspondingly decreases, with an increasing tendency to accumulation of heat at the nose. In the case of high-speed tools, as with carbon-steel tools, in many cases a false point is built up upon the nose of the tool composed of fine particles scraped from the surface of the work, which gives the appearance of having been fused on to the nose, and which no doubt is continually being ground away in the process of rubbing of the chip upon it, as well as replenished by the process of building up. There does not appear to be the same cumulative blunting of the high-speed tool as is the case with the carbon-steel tool, but when once the cutting edge of the tool is damaged, heating, fusing, and breakdown occur almost instantaneously.

The tools were tested for the following areas of cut on each bar:—

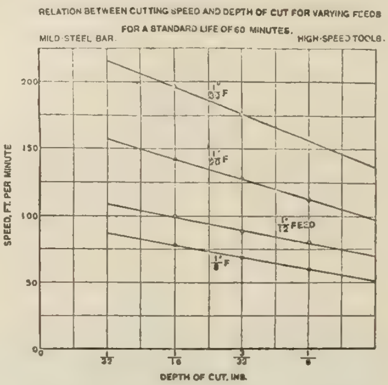
Depth of cut. inch.		Feed per revolution. inch.			
1-16	×	1-30.	1-20.	1-12.	⅛
3-32	×	"	"	"	"
⅛	×	"	"	"	"

Cutting Speed and Durability of Tool.

Altogether upwards of 200 tests were made, the duration of each test ranging from about 1 minute to 70 minutes. For each area of cut (or rather combination of depth of cut and feed per revolution) data for a cutting speed-duration curve were obtained, and curves Figs. 25, 26, and 27 were plotted as shown. The curves in the figures are identified with the bars as follows:—

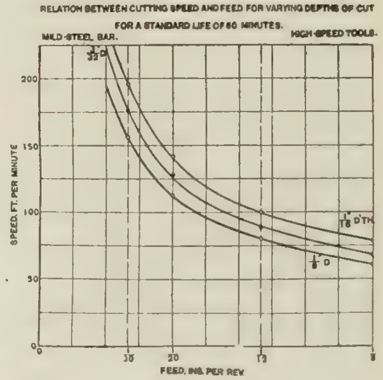
Fig. 25	Bar A	(mild steel)
„ 26	„ B	(medium steel)
„ 27	„ C	(hard steel)

Fig. 30.



RELATION BETWEEN CUTTING SPEED AND DEPTH OF CUT FOR VARYING FEEDS FOR A STANDARD LIFE OF 60 MINUTES.

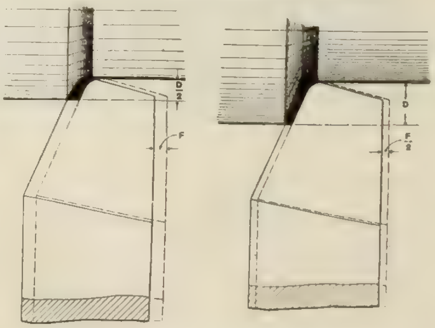
Fig. 31.



RELATION BETWEEN CUTTING SPEED AND FEED FOR VARYING DEPTHS OF CUT FOR A STANDARD LIFE OF 60 MINUTES.

Figs. 32 and 33.

DIAGRAMS SHOWING EFFECT OF DEPTH AND FEED ON LENGTH OF CUTTING EDGE.



The curves are for a feed of 1-12-inch per revolution of the test-bar, the depth of cut in each case being stated on the curve.

These curves, Figs. 25, 26, 27, 28, when compared with the corresponding curves for the carbon-steel tools, Figs. 12, 13, 14, show clearly the extraordinary difference in cutting speed area of cut, and output which is possible with the use of high-speed tools of the same section as in the carbon-steel tool tests. The curves also show the effects of hardness of the bar and area of cut on the cutting speed, and the relation between the cutting speed and the life of the tool up to the point of breakdown or failure. They further indicate, as do the corresponding curves for the carbon-tool tests, that, at high cutting speeds, the durability of the cutting edge is very short, but that as the rate of cutting is reduced to a speed which permits of a durability of 40 or 50 minutes, the tool then continues to cut for a more or less indefinite period, as indicated by the approach of the curves to the horizontal. If this speed is, however, exceeded by from 10 to 15 per cent., the life of the tool is rapidly shortened.

The average relation between the cutting speeds and the life of the tool M in minutes for any given area of cut between durations of 10 and 60 minutes is represented approximately by the formula

$$S \times M^{1\text{-}12} = \text{constant} \quad . \quad . \quad (5)$$

The value of the constant depends, as before, upon the quality of the steel being turned and upon the area of cut. The relation between these two quantities, as determined by Mr. F. W. Taylor for high-speed turning tools, is

$$SM^{1/8} = \text{constant}.$$

Cutting Speed and Area of Cut.

For each test-bar the relation between the cutting speed and the associated area of cut for a standard life of 60 minutes was determined, the data in regard to the cutting speed being drawn from the curves of which Figs. 25, 26, and 27 are representative. Contrary to the experience and views of Dr. Nicholson, and in agreement with those of Mr. F. W. Taylor, it was found that the cutting speed did not depend only upon the area of cut as such, independently of its component factors, but that it depended upon these factors—namely, the depth of cut and the feed per revolution, in two different ways. Thus referring to the curves on Fig. 29 and taking a cut ⅛-inch deep and 1-20-inch feed, it is seen that the associated cutting speed belonging to these conditions is 112 as measured from the top curve, where it is intercepted by the 1-20-inch constant feed line. Now, taking the same area of cut, made up by a cut 1-16-inch deep and 1-10-inch feed, the associated cutting speed under these conditions as measured from the bottom curve for the same area of cut is 93. In other words, the output in the two cases would not be the same, but in the ratio of 112 to 93 in favor of the deep cut over the large feed.

This is further explained in Figs. 30 and 31, in the former of which the relation between the cutting speed for standard tool life and the depth of cut is shown for the various feeds adopted, whilst in the latter the relation between the cutting speed and the feed per revolution is given for the various depths chosen, the curves referring to bar A in each case.

It is seen in Fig. 30 that a cut ⅛-inch deep by 1-20-inch feed is taken at a greater cutting speed than a cut 1-16-inch deep by 1-10-inch feed, which is of equal area, but less efficient as a means of output, as already explained. A similar deduction can be made from Fig. 31, where it is seen that a cut, say, ⅛-inch deep by 1-24-inch feed, is taken at a greater cutting speed—namely, 125 feet per minute, while a 1-16-inch deep by 1-12-inch feed is taken at 100 feet per minute.

Some explanation of this is given in Figs. 32 and 33. In each of these figures a tool having the standard shape of nose is represented taking a cut of a definite area, this area being the same in the two cases. In the case of Fig. 32, the depth is one-half of that in the case of Fig. 33, while the feed per revolution is twice as great. It will be noticed that the length of the cutting edge which is in contact with the work in the first case is considerably less than the corresponding dimension in the second case; and there is, in the second case, therefore, a correspondingly larger cooling area behind the cutting edge to conduct the heat away as it is generated than there is in the first case. Under such circumstances, therefore, other things being equal, the rise in temperature of the cutting edge of the second case will not be so rapid as that occurring in the first case. In other words, a higher cutting speed can be employed with the tool having the longer cutting edge.

An examination of Figs. 30 and 31 shows that the cutting speed is a linear function of the depth of cut, whilst it depends upon some power of the feed per revolution other than the first. The relation deducted from the above figures is:

$$S = \frac{K_1}{(\text{feed})\ 2\text{-}3} - (K_2 - K_3\ \text{feed})\ \text{depth} \quad . . (6)$$

in which S = the cutting speed in feet per minute, and K_1, K_2, and K_3 are constants, the values of which depend upon the quality of the steel being machined. For the three bars, A, B, and C, the constants are as follows:—

	Bar A.	Bar B.	Bar C.
K_1	24	21	9
K_2	780	584	268
K_3	4,000	3,340	1,530

As will be shown later, however, the above formula may be reduced to a simpler though somewhat approximate form.

Output of High-speed Tools.

The standard output of a high-speed turning tool is defined in these tests as the number of cubic inches which the tool will remove in the standard life of a tool, that is, in a run of 60 minutes and breakdown at that point. This volume of material for each cutting speed and associated depth-feed combination has been calculated from data obtained by measurement from the curves for the three bars, and the relation between this quantity and the cutting speed determined for each case. The curves for bar A are given in Fig. 34; the curves for the other bars are similar in form.

This figure shows that the maximum output, or removal of metal, is associated with the lowest cutting speed, with which, for a standard life of 60 minutes, the heaviest depth-feed combination is associated; the greater influence being, of course, on the side of the depth. Thus, with a depth of cut of ⅛ inch and a feed of 1-20 inch per revolution, the volume of metal removed in 60 minutes is 504 cubic inches; whilst, with a depth of cut of 1-16 inch, or one-half of the above and double the feed—namely, 1-10 inch, the output is 405 cubic inches per hour. This shows a gain of about 25 per cent. of output in favor of the deeper cut with a reduced cutting speed. This law applies generally to all the bars and speed depth-feed combinations. Hence, it may be stated that for the maximum tool output, the area of cut is a maximum which the tool will stand without fracture, with the depth of cut a large factor, and the associated speed correspondingly low.

Fig. 34.

RELATION OF OUTPUT TO CUTTING SPEED, FEED, AND DEPTH OF CUT.

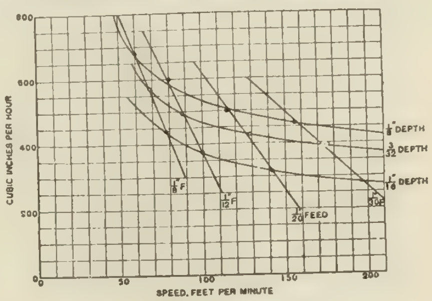


Fig. 35.

RELATION OF OUTPUT TO AREA OF CUT, FEED, AND DEPTH OF CUT.

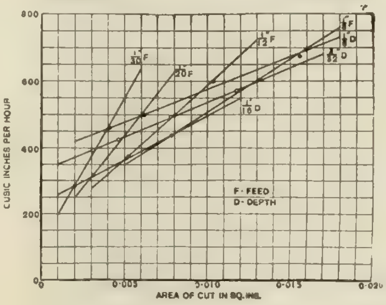

Fig. 36.

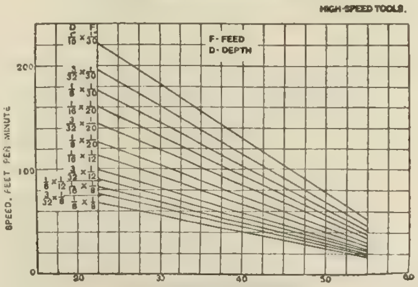
RELATION BETWEEN CUTTING SPEED AND HARDNESS OF BAR.



This is also indicated in Fig. 35, which shows the relation between the area of cut and the output of the tool. From an examination of this figure, it will be seen that for any given area of cut the tool output is reduced if the depth of cut is reduced and the feed is correspondingly increased, this being due to a consequent reduction in the associated cutting speed for a standard life of 60 minutes. On the other hand, if the depth is increased and the feed is reduced accordingly, then the tool output is increased. This is due, of course, to an increase in the associated cutting speed.

Cutting Speed and Hardness of Bar.

In Fig. 30 is shown the relation between the tensile strength of the metal being machined and the associated cutting speed for the different depth-feed combinations used in the tests. These lines show the general condition of a fall in working cutting speeds as the area of the cut is increased and as the hardness of the material to be cut is increased. The law is practically a straight-line law, as in the case of the carbon-steel tests, the equation to the law being:

$$S = \frac{(65 - T) \times 0.207}{\sqrt[3]{\text{feed}^2 \times \text{depth}}} \quad . \quad . \ (7)$$

in which S = the associated cutting speed in feet per minute, and T = the tensile strength of the metal being machined, in tons per square inch; or, for mild steel, this equation becomes:

$$S = \frac{8.28}{\sqrt[3]{\text{feed}^2 \times \text{depth}}} \quad . \ . \ . \ (8)$$

This expression has been deduced in place of the more complicated expression (6) given above, and although approximate, it is only slightly so. In regard to expression (6), it should be pointed out that it could be arranged to include a function or functions of the tensile strength by determining the relation between the values of the constants, K_1, K_2, and K_3, and the tensile strength, since these—the constants—are the only quantities which depend upon the tensile strength, and they depend upon this only. Expression (7) is, however, a much simpler and more desirable form. It clearly shows that the influence of the depth of the cut is not the same as that of the feed upon the value of S, but that S is inversely proportional to the cube root of the square of the feed and to the cube root of the depth. This indicates, as do Figs. 29, 30, and 31, that, for any given area of cut, a higher "associated" cutting speed can be employed, with a corresponding increase in the output, when the cut is deep and the feed fine than when the cut is shallow and the feed coarse.

By the aid of this equation, it is easy to show the effect on the output of varying the ratio of these two factors with a constant area of cut; thus, for example, if the area of the cut is doubled by doubling the depth of the cut, the influence on the associated cutting speed is shown to be less than when this increase in area is effected by doubling the feed, as follows:—

By slightly modifying expression (7), we obtain—

$$S = \frac{K}{\text{Feed } 2\text{-}3 \times \text{Depth } 1\text{-}3} \quad . \; . \; . \; (9)$$

where $K = (65 - T) \times 0.207$

Suppose, now, that the area of the cut is doubled by doubling the depth of the cut, the corresponding value of—

$$S_1 = \frac{K}{\text{Feed } 3\text{-}8 \times (\text{Depth} \times 2)\ 1\text{-}3} = 0.7938 S.$$

If, however, the feed is doubled instead of the depth, we find that the corresponding value of—

$$S_2 = \frac{K}{(\text{Feed} \times 2)\ 2\text{-}3 \times \text{Depth } 1\text{-}3} = 0.6299\ S.$$

These figures demonstrate the point referred to above. Whilst there is only a 21 per cent. reduction in the cutting speed in the double-depth case, there is a 37 per cent. reduction in the double-feed case. Or, the double-depth cutting speed is 26 per cent. higher than that associated with the double-feed case; and since the two areas of cut are the same, the method which is associated with the higher cutting speed will, of course, produce the greater output.

The question of the influence on the output of the depth of cut and the feed per revolution can also be considered directly by regarding the cutting speed as a function of the depth and feed. Thus, let $V =$ the volume of metal, in cubic inches, removed per hour, then—

$$\begin{aligned} V &= 12\ S \times A \times 60 \\ &= 720\ S\ A \\ &= 720\ S\ F\ D \quad . \; . \; . \quad (10) \end{aligned}$$

where S. F. and D represent the cutting speed, the feed, and the depth respectively. Now, from expression (9), we have that—

$$S = \frac{K}{F\ 2\text{-}3\ \ D\ 1\text{-}3}$$

Therefore

$$\begin{aligned} V &= \frac{720\ K\ \ FD}{F\ 2\text{-}3\ \ D\ 1\text{-}3} \\ &= 720\ K\ \ F\ 1\text{-}3\ \ D\ 2\text{-}3 \\ &= CF\ 1\text{-}3\ \ D\ 2\text{-}3 \ . \; . \; . \ (11) \end{aligned}$$

C being a constant depending upon the tensile strength of the metal being turned, and being equal to 149 (65 — T), T being the tensile strength, in tons per square inch, of this metal.

The influence on the speed, and, therefore, on the output of a change of feed for any given area of cut is also shown from the following: as before—

$$\begin{aligned} S &= \frac{K}{F\ 2\text{-}3\ \ D\ 1\text{-}3} \\ &= \frac{K}{3\sqrt{\ F^2 \times D}} \end{aligned}$$

but F D = A (area of cut); therefore—

$$S = \frac{K}{3\sqrt{\ A \times F}} \quad . \; . \; . \quad (12)$$

This shows that if A is maintained constant,

$$S = \frac{\text{constant}}{F\ 1\text{-}3} \quad . \; . \; . \; . \quad (13)$$

Fig. 37.

EFFECT OF SHAPE OF NOSE ON CUTTING SPEED FOR STANDARD LIFE OF TOOL

HIGH-SPEED TOOLS.

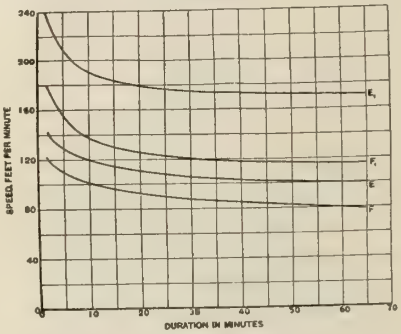


Fig. 38.

RELATIVE OUTPUT OF HIGH-SPEED AND CARBON STEEL TOOLS.

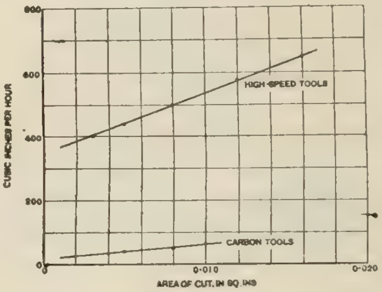

Fig. 39.

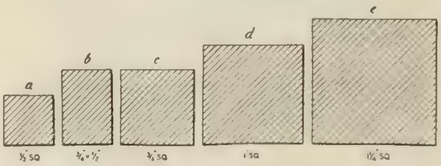
SECTIONS OF TOOL STEEL TESTED.



Shape of Cutting Edge.

As in the case of the carbon-steel tool tests, the effects of a change in the shape of the nose of the tool and in the disposition of the cutting edge of the nose with respect to the axis of the test-bar was considered. The change of the shape was made from the standard, Fig. 1, to the shape illustrated in Fig. 21. The test conditions were exactly the same as in those of the previous tests. Sample comparative curves are shown in Fig. 37. Curves E and E_1 are for the same area of cut (1-16 inch by 1-12 inch) for the two different shapes of nose on the same bar, E representing the standard, Fig. 1, and E_1 the second shape. Curves F and F_1 are corresponding curves for another area of cut (1-16-inch by ⅛-inch).

An examination of these curves will show that, for a life of 60 minutes, the second shape of nose will, other things being equal, admit of a higher cutting speed being employed, and will, therefore, be capable of greater output.

Tools of Small Section.

For an area of cut, ⅛-inch by 1-12-inch, the cutting speed which will allow the tool to last one hour under the above conditions is 78 feet per minute for the high-speed tool, and 8 feet per minute for the plain carbon-steel tool on a bar having a tensile strength of about 25 tons per square inch. This ratio is about 10:1, that is, for a cut as above, the high-speed tool will remove ten times as much metal from stock as will the plain carbon-steel tool in a given time; or it will remove any given amount in one-tenth of the time.

A graphical comparison of the performance of high-speed and plain carbon turning tools is shown in Fig. 38.

Output and Cross-sectional Area of Tool-Steel.

To find the effect on the output of the use of high-speed tool-steels of various cross-sectional areas, a number of experiments were made with tool-steels of sections shown in Fig. 39, commencing with ½-inch square section, and proceeding to ¾-inch by ½-inch; ¾-inch square; 1 inch square; and 1¼ inch square. All these tools were prepared with a cutting edge of exactly similar geometrical form at the cutting nose, the form being the same as already illustrated in Fig. 1. The tools were all tested on one common mild-steel test-bar A about 20 inches diameter and 10 feet long.

The object of the tests was to determine the maximum output with tools of each of the above sections, and then to compare the relations of these outputs with one another. The method adopted for determining the maximum output was to employ the "speed-increment" test described later.

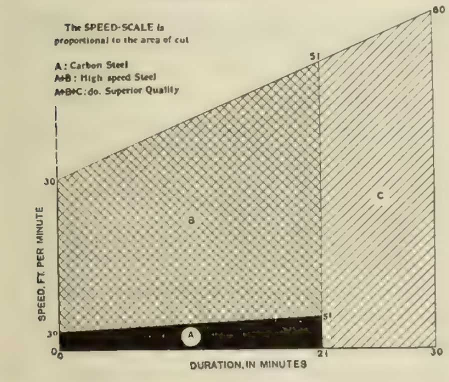
An experiment was first made upon sample tools of each section to find what depth of cut the tool would take, with a given feed, to break it down in exactly 20 minutes. It was found possible to adjust the depth of cut in such a way that the tool would break down within a few seconds above or below the 20 minutes period. The feed was kept constant at 1-12-inch per revolution throughout all the tests. The commencing cutting speed chosen was 75 feet per minute, and the cutting speed was increased by 1 foot per minute speed increment, every minute, until the breaking-down point was reached. The breaking-down cutting speed in each case was, therefore, 95 feet per minute.

The total material turned off during the test for each particular tool section is proportional to the respective depths of cut employed. The results of the tests are plotted on Fig. 40, and a curve drawn through the points, a, b, c, d and e representing the results obtained respectively with the tools of the above sections. The tool taken as the standard or unit section was ¾-inch by ½-inch, this being the size of tool employed throughout all the tests mentioned in the previous parts of the paper, see b, Fig. 40.

From this curve it is now possible to convert the output obtained with a cutting tool of any given section into its equivalent output for any other given section, each working respectively with its appropriate or associated area of cut. Since the speeds in these tests were similar for each size of tool, the respective output factors represent actually the proportional areas of cut taken by the standard tool. Thus, taking the ¾-inch × ½-inch as the unit, the following table of factors is prepared so that when the output given by the ¾-inch × ½-inch tool is known, this output multiplied by the factor opposite the required section of tool-steel gives the equivalent output for that section. The factor is also shown on a scale on the right-hand side of Fig. 40.

FIG. 44.

AREAS REPRESENTING RELATIVE OUTPUT OF TOOL STEELS OF VARIOUS QUALITIES



The relation between the cross-sectional areas of the tool-steels and the associated depth of cut with constant feed and constant average cutting speed is found to be given approximately as follows:—

$D = \sqrt{A} \times \text{constant}$, . . . (14)

in which D = the depth of cut (with a constant feed and constant average cutting speed) and A = the cross-sectional area of the tool-steel; also

$\text{Output} = \sqrt{A} \times \text{constant}$ . . . (15)

Equivalent Output for Tool-steels of Various Sections.

Section of Tool-Steel. Inches.		Inches.	Output Factor.
½	×	½	0.80
¾	×	½	1.00
⅝	×	⅝	1.17
¾	×	¾	1.27
⅞	×	⅞	1.43
1	×	1	1.60
1⅛	×	1⅛	1.73
1¼	×	1¼	1.87
1⅜	×	1⅜	2.00

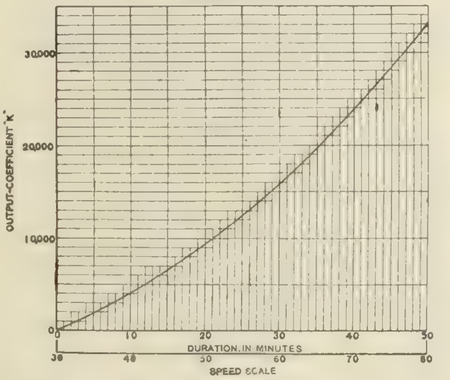
Relation of Motor Power to Output.

To determine the relations existing between the area of cut, the associated speeds, and the actual horse-power requirements, tests were made on the different bars with the various adopted depths of cut and feeds and their associated cutting speeds, the power consumption in each case being obtained by taking voltmeter and ammeter readings. These readings were taken when the cut was in, and again when it was not in (the speed being the same in each case), the net horse-power (that is, the horse-power required to accomplish the actual cutting) being calculated from the difference between the two readings.

FIG. 45.

STANDARD CURVE GIVING VALUES OF THE OUTPUT-COEFFICIENT "K"

K×AREA OF CUT=OUTPUT



It will be seen that the actual net horse-power required to remove a given number of cubic inches per hour is a constant for each quality of steel machined. In other words, the output per horse-power is practically a constant quantity; that is, for a given output per hour there is nothing to gain from the point of view of economy in net power consumption by altering the ratio of area of cut to speed of cutting, the net horse-power required being approximately directly proportional to output only.

Another point to observe is that the number of cubic inches removed per horse-power depends upon the hardness of the bar being machined; the harder the bar the less the number of cubic inches removed per horse-power hour.

If the results of the experiments shown in the tables are plotted, and an average line be drawn through the points, an approximate law can be determined showing the relation of output in cubic inches per horse-power hour to hardness of bar. This line is drawn in Fig. 41, and the law determined from it is found to be given by the formula.

Cubic inches per h.p. hour $(167 - 1.7\ T)$ . . . . (16)

where T = tensile strength in tons per square inch; or, expressed as weight W in lb. per h.p. per hour,

$W = (47 - 0.48\ T)$ . . . (17)

Again, if the tensile strength of the material being turned is plotted against the net horse-power required per lb. of material turned off per minute, it will be found that the power required for any given quality of bar (see Fig. 42) is expressed by the formula.

Net h.p. per lb. per minute $= (0.8 + 0.37\ T)$ . . . . (18)

Thus, taking T = 25 tons per square inch, we have

Net h.p. per lb. per minute $= 0.8 + 0.37 \times 25 = 1.725$.

It should be noted that the power given above does not include the power required to drive the lathe itself when running with the cut withdrawn. The additional power required to drive the lathe when the cut is in inches:—(i)—The power required to perform the operation of cutting, together with (ii) the additional friction of the lathe-saddle on its bed due to the pressures on the tool. The latter item (ii) is small, and the whole additional power is, therefore debited to the process of cutting.

Conclusions From High-Speed Tool Tests.

1.—The breaking-down point of a high-speed tool is usually well defined, it being indicated by a more or less sudden refusal on the part of the tool to cut, accompanied by a polishing of the surface of the work due to collapse by fusion at the cutting edge.

2.—The durability of high-speed steel tools is in all cases some function of the reciprocal of the cutting speed; in other words, the higher the cutting speed the shorter the durability, and vice versa.

3.—For a reasonable working duration or life of a tool (say, 60 minutes as a standard) high-cutting speeds are invariably associated with light cuts, and low-cutting speeds with heavy cuts; that is, high-cutting speeds and heavy cuts do not co-exist.

4.—The cutting speed which is associated with a given area of cut to permit of a given or standard life of tool depends upon the relation between the depth of the cut and the feed per revolution, so that there is a definite "associated" cutting speed for any area of cut for each of the ways in which the depth and feed are combined to form the area.

5.—If the area of the cut is kept constant, a higher associated cutting speed is obtainable when the cut is deep and the feed fine, than when the cut is shallow and the feed coarse.

6.—A tool working at a low-cutting speed with its associated depth-feed combination will accomplish a greater output in the standard life of the tool than will a tool which is working at a high cutting speed with its associated depth-feed combination.

7.—For maximum tool output the area of the cut employed is the maximum which the tool will stand without fracture, with the depth of cut a large factor and the associated cutting speed correspondingly low.

HIGH-SPEED TOOLS.

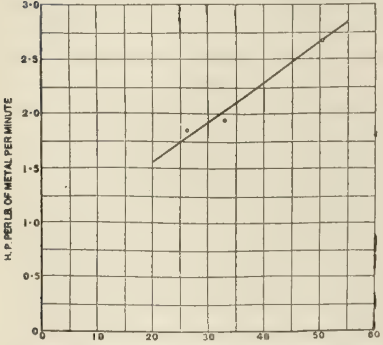

Fig. 43.

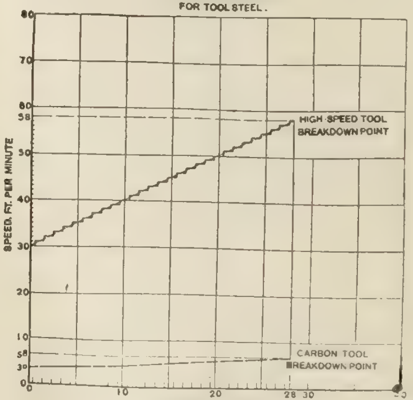
SPEED-INCREMENT TEST FOR TOOL STEEL.



8.—The associated cutting speed for any depth-feed combination depends upon the quality of the material which is being operated upon, a high cutting speed being associated with a low degree of hardness, and vice versa.

9.—A tool with a long cutting edge has a longer life (under similar conditions of depth of cut, feed per revolution, cutting speed, and tensile strength of the metal being machined) than one which has a short cutting edge.

10.—The number of cubic inches removed per net horse-power hour is practically a constant quantity for each quality of material turned when the tools work under the standard conditions, whatever the area of cut or depth-feed combination.

There is, therefore, no economy in energy-consumption to be gained by using high or low-cutting speeds, or light or heavy cuts, provided that the tools work under standard associated conditions of speed and cut. There is, however, an economy in time-consumption to be gained by using low-cutting speeds and the heavy cuts associated with them.

Speed-Increment Test for Turning Tools.

Since the introduction of high-speed steel for turning and other tools, the question of the comparative testing of steels of this kind has become a very important one, both to the manufacturer and to the user of such steel. Comparative tests are necessary to the manufacturer in his efforts to improve the qualities and capabilities of his products (from the standpoint of chemical composition as well as of heat treatment): and to the user in his efforts to compare the various makes of steel of this kind, with a view to obtaining the best tool for any particular class of work.

The ordinary comparative test consists of running the test-bar at a constant circumferential speed (such as 60 feet per minute) and causing the tool to take a cut of standard dimensions until it breaks down or loses its cutting edge, the duration of the test, or the life of the tool under such circumstances, being taken as the criterion value by which to estimate the quality of the tool.

The method introduced and adopted by Mr. F. W. Taylor involves the selection of a fixed duration of test—namely, 20 minutes, the object of the test being the determination of the speed (under given and constant conditions of area of cut, etc.) at which the cut may be made to break down the tool in 20 minutes. To carry out this test satisfactorily, a fairly large number of tools must be made from the same bar of steel, the required number varying from four to eight.

The method adopted in the machine-tool laboratory of the Sheffield University is one in which a uniformly accelerated cutting speed is the essential part. The form of the test is comparable with the method of applying the load in a tensile test. It has been designated the "Speed-increment Test," because starting at a definitely fixed cutting speed, a constant increment of 1 foot per minute is added to this cutting speed every minute. The number of cubic inches which the tool removes up to the point of break-down is taken as the numerical value by which its quality is judged.

The principle of this test is as follows:—The tool is started to cut at a starting speed of 30 feet per minute with a standard area of cut on the test bar. By "standard area of cut" is meant the area of cut which will secure a test of about 20 minutes' duration for one tool of the set, its magnitude varying according to the hardness of the test-bar and the sectional area of the tool-steel. This area of cut, once decided, is used for each tool of the series.

This cutting speed is accelerated at the end of each minute at the rate of 1 foot per minute, to the end of the test, that is, until the break-down point of the tool is reached. At the beginning of the test the first speed of 30 feet per minute is run for ½ minute only, for the purpose of getting a straight average line on the output diagram, Fig. 43. In all other cases the time of running is a one-minute period for each newly accelerated speed.

From the data obtained during the test, the number of cubic inches of metal removed by the tool during the test can be calculated, this number being taken as the criterion value by which the quality of the tool is judged. This number equals the average cutting speed during the test in feet per minute × 12 × area of cut in square inches × duration of the test in minutes.

The speed-time curve for this test is indicated in Fig. 43. The stepped line indicates the progressive nature of the test for high speed steel to the breaking-down point. Towards the bottom of the diagram the same method of test is shown for the carbon-steel tool. The vertical scale in the two cases is made proportional to the respective areas of cut. The vertical steps in the case of the carbon-steel tool are too small to be shown. The areas enclosed between the respective speed-increment lines and the base represent the amounts of material removed.

In Fig. 44 are represented the cases of three tools:

(1)—A plain carbon-steel tool; (2)—an ordinary high-speed tool; and (3)—a superior high-speed tool. In the case of (2) and (3) the same area of cut was used, but in the case of the first a much smaller area of cut had to be used, the ratio of the two areas being equal to the ratio of the speed scales of the figure. Tools Nos. 1 and 2 lasted for 21 minutes, whilst tool No. 3 lasted for 30 minutes. The output of the plain carbon-steel tool is represented by the area A; that of the ordinary high-speed tool by the sum of areas A and B; and that of the superior high-speed tool by the sum of areas (A + B) + C.

The final speed of cutting of the first high-speed tool was 51 feet per minute, and of the second high-speed tool 60 per minute, so that the mean cutting speeds were 40.5 and 45 feet per minute respectively; therefore, the criterion values of these two tools were respectively (40.5 × 21) = 850.5; and 45 × 30 = 1,350. The ratio of these two values — namely, $\frac{1,350}{850.5} = 1.5$ is the ratio between the two areas (A + B + C) and (A + B) represented in Fig. 44, the larger area representing the case of the better tool.

This test can only be made on lathes which are provided with means whereby the speed can be changed instantaneously (or nearly so) and in regular and definite amounts.

To render elaborate calculations unnecessary in connection with this test, a curve Fig. 45, which gives the relation between what has been designated the "output co-efficient" and the duration, has been worked out. This co-efficient is actually the length of the turning removed under the above conditions by the tool in inches in any given time, so that the number of cubic inches removed in that time is found by multiplying the constant for the time by the area of the cut. This renders the determination of the average speed during the test unnecessary. The diagram, Fig. 45, is used as follows:

The zero of the diagram represents the starting point of the test at the cutting speed of 30 feet per minute; at the end of 10 minutes the speed has obviously increased to (30 + 10) = 40 feet per minute; at the end of 20 minutes the cutting speed is (30 + 20) = 50 per minute, and so on.

To find the material turned off in the case of a tool which has broken down after a speed increment test of, say, 33 minutes, we take the value K from the diagram, which is 18,000. Multiplying this by the area of cut equals the output in cubic inches, which is the number representing the criterion value of the tool; thus for a cut 3/8-inch by 1-12-inch, we have 18,000 by 3/8 by 1-12 = 562.5 criterion number. A special feature of this method of testing tool-steels is the exceedingly regular results obtained when repetition tests are made.

The Attribute of Loyalty Relative to Business Life*

By Charles L. Clarke **

The author of this paper is a keen observer of human nature and recounts a number of its more or less prominent weaknesses when tasks irksome and distasteful fall for performance. The appeal for whole-hearted loyalty, and a determination to overcome or at least minimize the tendencies towards its repudiation, implied or otherwise, is a universally personal one.

THE geenral subject of loyalty in business life should always be of interest because it concerns certain relations between men that vitally affect their material interests. It is specially worthy of earnest consideration by the younger men, whose business careers still lie in the future, and whose habits of mind and dispositions have not become so firmly set that they should have much difficulty in subjecting themselves to a fair self-examination in the light of reason, and, if necessary, gain thereby with sensible exercise of will such control over adverse inclinations, when present, as will naturally cause them to be loyal to their business associates on every occasion. The younger men might here note the words of the immortal Franklin, who made the appropriate remark, through the sayings of "Poor Richard," that " 'Tis easier to prevent bad habits than to break them."

It must be admitted that the subject of loyalty is a delicate one to deal with, when presented, as in this instance, to one's business brethren, but here, again, heed Poor Richard's injunction: "Love your enemies, for they tell you your faults;" although it may be admitted that human nature is so constituted that sometimes a friend is not so easily forgiven as are enemies for doing this kindness.

The attention given the subject here will be distinguished more by what is omitted than by an exhaustive presentation of its many sides, and it is left to the imagination and experience judiciously to read between the lines to supply the missing links, and make such personal application of the whole as self-examination and conscience may direct; for, in matters pertaining to loyalty each individual must shape his own course, as he is the maker of his own destiny. No one can supply the deficiency of another in this essential for a helpful attitude toward those joined in effort for a common good.

The Definition of Loyalty.

It is unnecessary to comb the dictionaries for scholarly definitions of the term "loyalty," or to find out what "business life" means. Normally constituted persons will doubtless substantially agree to the general proposition that loyalty in business life is the faithful endeavor successfully and justly to perform an assigned task or duty of lawful nature, with which two or more persons are concerned, relating to some mutual material advantage measurable in dollars and cents.

Further, for the purpose of keeping consideration of the subject within reasonable bounds, that we may not become lost in the mazes of a philosophical dissertation, and fail to make such practical application of its leading principals as may be advantageous to ourselves, let it here be restricted to loyalty in duties required to carry on the affairs of a corporation, which are apportioned to employes in accordance with a system of management organized for orderly and profitable conduct of business.

Loyalty to a Corporation.

The loyalty, then, that should subsist in a corporation is:

1.—Loyalty to the system of management as organized, and not, necessarily as one may think it should be, and would like to see it organized. The system is impersonal, and comprises a code of corporation business rules and regulations, sanctioned by law and effective thereunder. It is the guide-post which points in the directions in which employes should go in the line of efficient duty; if not thus guided and obedient thereto they would soon become lost in confusion. The rules and regulations of a corporation are the underlying means by which duty is assigned and directed, and anything less than faithful effort to observe them is disloyalty to the whole business in hand and to every one whose welfare depends upon its success.

---

*From the General Electric Review.

**Consulting Engineering Dept., General Electric Co.

2.—Loyalty within the system to the persons in whom is vested the authority to manage the details pertaining to the assignment and direction of duties. Those in authority are absolutely dependent upon the loyalty of others under them for the business success of a corporation, and they could accomplish nothing without it no matter what their own ability might be. The higher the plane of authority on which they stand, the wider becomes the scope of the undertakings for which they are responsible; the greater are the trials they have to bear, and the severer is the tax on their patience, resourcefulness, common sense and endurance to keep even themselves in every way loyal to the trust imposed upon them under the system. Thus, they need the loyal support of every one else to a special degree.

3.—Loyalty within the system between those whose authority or duties are practically co-extensive. Here, there should be unreservedly faithful co-operation, absence of petty jealousy, undue self-seeking, over-reaching, bickering and backbiting, which interfere with efficiency and can prove serious forms of disloyalty, and are liable, even if the seed be sown by only one person, to produce much harm.

4.—Loyalty, irrespective of the system, between all employes of whatever grade, based upon mutual respect, general good will, pride in connection with the organization and with associates, and a sincere desire to help to the best of their ability to promote success.

Self Control and Patience Necessary.

It is not easy for every one, and, at times, not even for those most experienced and disciplined, always to be loyal to every duty. Sometimes its performance, as the saying is, "goes against the grain," in which case such adjustment to conditions should be made that "chips do not fly." At other times its performance may seem unnecessary, or the wrong way of getting at a desired result, and these are times when loyal patience is called for, patience to wait for time to tell one whether after all he may be mistaken or to correct a method, if later found not the best one to pursue. While it is easy to be patient under accustomed circumstances, it becomes more difficult of exercise under trying conditions, when most required, in which connection it should be helpful to remember that Poor Richard said: "What signifies your patience if you can't find it when you want it."

Temperamental Peculiarity Hindrance.

Temperamental peculiarities seem to make it practically impossible in some unfortunate instances for loyalty willingly to exist, the misfortune being mainly harmful to those thus afflicted, for they are either certain to be kept outside the pale of organized business, or to be bound hand-and-foot by limited duties and restricted authority so that they lose opportunity for achievement and advancement that might be theirs.

Then, there are some whose characteristics only occasionally cause them to clash with the business system or with their co-workers, and become disloyal by not taking up and endeavoring to perform an allotted duty in line with the directions of their superiors. The effect is disturbing, so much so as to have a correcting influence on men of intelligence toward lessening or preventing repetition of the mistake. If they prove to be men in positions of authority, Poor Richard here advises them: "He that cannot obey cannot command."

Specialization Hindrance.

Sometimes the cause of opposition to authority and orderly compliance with a business system proceeds not so much from temperament as from specialization, to the neglect of the everyday concerns of life. While there has been development in a particular direction to an unusual degree, advancement in other ways, essential to constitute the normal practical man, is wanting.

It is true, the specialist and his calling may be such boon companions that there is intense satisfaction in the partnership. Nevertheless, when it leads to a life so self-centred that the outside world—in which he would naturally prefer to include the corporation from which his subsistence comes—is largely unknown or quite forgotten, the points of business contact and resulting pressure of duty, which must exist at times, are apt to be resented as an intrusion and infraction of an imagined right simply to be let alone and not be bothered. Or he may not only be specialized so highly, but so self-exalted, perhaps over some truly noteworthy achievement, as to arrogate to himself special rights superior to the system, and consider himself not accountable to his immediate superior, but somehow entitled to sit at the right of the throne and otherwise do about as he pleases.

He is likely to have what he chooses to call his "self-respect" easily injured by his superiors acting under the compelling requirements of business, but closer examinations would often discover that only his conceit has been pricked. A real or imagined injury to one's self-respect is no excuse for non-performance of duty. Even should the injury be real, the act of the offender which would constitute disloyalty on his part, conveys no right to retaliate by being in turn, disloyal; there are obviously other and proper ways of mending the fault.

It behooves such a person, when he feels that he is being imposed upon by the system, to realize with Poor Richard that "It is the easiest thing in the world for a man to deceive himself," and try to discover whether this may be the fact in his case, and ascertain if he be after the truth, that his first duty is loyalty to the system whatever it may be, at least as long as he chooses to rely upon it for his bread and butter.

The Jealousy Feature.

Jealousy, which in its different manifestations may be given various names but smells no sweeter therefor, is, perhaps, the most frequent cause for lapses in loyalty. It is generally of the petty, evanescent sort, and fortunately, rarely manifests itself in the region of large responsibilities. Every one knows the cure, namely, get over it; towards the accomplishment of which end the realization that all must loyally work together, if the payroll is regularly to be met, should help.

Constitutional Derangement Feature.

The speaker will not trench upon the ground preempted by those engaged in the profession of healing bodily ills, further than to say that he has often noted instances where the question, whether a man would prove loyal or not for that day or longer was sure to depend upon the state of his digestion and thus his nerves. For such a condition of affairs there is no legitimate excuse. Ill health and nerves, short of derangement, will not interfere with loyalty, if the innate disposition is in that direction, or if experience has taught one wisely to control an antagonistic nature, and in any case, it is profitable to realize that, while incapacitating disability is no excuse for refusing, or grudgingly and inefficiently to perform one's duty, nevertheless, it properly justifies obtaining release therefrom.

The Crank.

Finally, there is the cranky man, who gets at odds with the system and with his associates on the most unlooked for occasions and for inexplicable reasons. His misfortune is inability to control impulse by exercise of will power, and he should make a special study of ways and means to cure the defect. Often he is mostly of good steel; the knife passes inspection and is placed in stock although the defects are recognized, but it will not, to his detriment, be rated A-1.

Do not let those that are disposed to chafe under the impersonal, impartial working of a business system, peevishly fall into the error of imagining that it was designedly created for their personal discomfort, as some appear to do. If, now and then, its application by a superior seems in some respects not just as it should be and disposes one to be disloyal, take Poor Richard's hint that "There is a time to wink as well as to see." Before we are over winking the incident is past and forgotten. Moreover, do not overlook the fact that superiors in authority generally have to do by far the greater part of the total winking, to the comfort and benefit of uneasy ones under them.

Schooling by Hard Knocks.

Whether the writer has appropriated the privilege of presenting some business principles, we may say maxims, that might more properly have issued from those in authority cannot be stated; possibly they have already expounded similar principles before our advent. Or, it may be, they have deemed it a better plan to let individuals work out their own salvation through experience acquired from hard knocks, in spite of the fact that, if analyzed to a conclusion, they will ordinarily be found to have a reactance quality, producing more or less of a hitch in the orderly flow of current affairs.

Some may have adopted this policy on the principle that a knock now and then may make the recipient, who invites it and is really worth keeping, wiser and hence more valuable. If such has been their policy, they may be quite right. Large manufacturing corporations today have generally adopted the policy of inaugurating special educational courses, at no inconsiderable expense, calculated to improve certain grades of service; and it may not prove a bad investment to foot the bills involved in maintaining a School of Hard Knocks, for inculcating and disseminating among naturally able employes, who may, unwittingly or in a temporary fit of perversity, have gone wrong, a correct understanding of the practical laws concerning the art of rendering their relations with business associates of maximum efficiency through loyalty.

By this time the reader may be wondering whether to plead guilty or not guilty. This is entirely unnecessary; no indictment has been found; the writer has filed no bill of complaint, or even expected to tread on anybody's toes, and undoubtedly has not done so. Although loyalty has been the subject under consideration, antithetically, disloyalty has necessarily been referred to, but there is no occasion for pessimism for human nature is more inclined to the virtues than to the wrong; and let it be known that loyalty in business is the rule and disloyalty is the rare exception, so rare in fact, and out of the normal, that for this very reason, it arrests immediate attention, and all the more so because of the always painful disturbance its occurrence produces in the customary, orderly progress of affairs and relations between men.

The stronger the effort made by all within the various departments of this great organization to constitute themselves a brotherhood of open-minded, open-hearted, mutually helpful men loyal to one another and especially so to their respective chiefs, the nearer will be the approach of the departments to ideal efficiency in performing the functions assigned to, and expected from them.

*

CORROSION AND RUSTING OF IRON.

MR. ERIC K. RIDEAL, in a recent paper before the Society of Engineers, said that a certain number of failures in constructional ironwork may be attributed to corrosion, and that rusting is a problem of the greatest importance to the water engineer. The author is a supporter of the electrolytic theory of corrosion, and believes it to be perfectly tenable when due attention is paid to considerations, such as alterations in the solution-pressures on crystal surfaces, and to the phenomenon of passivity shown by this metal.

Corrosion is due either to internally generated electric currents or to those from external sources. The theory is applicable to the problems of rusting in ferro-concrete, waterpipes and structural ironwork, as well as to the action of stray currents from tram rails, damp electric light leads and telephone cables.

In the light of that theory, both the plating of iron with metals or covering the surfaces with paints and varnishes are to be regarded as means to an end—namely, to prevent the formation of local "corrosion cells." The effect of pitting in steel pipes is to be attributed to inclusions of slag and oxides of iron.

Metallic coatings must be perfectly uniform in character, otherwise rusting may be augmented instead of retarded by such processes, while paints should be applied to clean surfaces and should possess certain definite characteristics, such as high specific electrical resistance, a pigmentary vehicle that does not readily liberate water during the process of aerial autoxidation and is not permeable to water vapor when thus oxidized, and pigmentary particles not widely separated from iron in their electrochemical potential.

*

PROTECTION OF UNFINISHED CONCRETE WORK FROM FROST.

IN a paper before the Boston Society of Civil Engineers, recently, Leonard C. Wason, president the Aborthan Construction Co., Boston, Mass., stated that the aggregate must be free from frost when mixed. A live steam pipe can be shoved into the sand pile, the escaping steam heating it and removing all frost. The same may be done with the stone, but a canvas should be thrown over the top of the pile to retain the heat, which more readily escapes. Where a considerable amount of heating is provided for in advance, steam pipes are laid on the ground, and stone as received is dumped upon them. Then there is a canvas thrown over to prevent storms getting into the pile, and to retain heat. The frost is thus easily and economically removed.

"Salt is frequently used in the water to lower its freezing point, and it is seldom worth while to heat the water itself. Little care need be used to prevent mass concrete from freezing, as the frost will usually only strike to a depth of about one inch. Buildings are enclosed with tarpaulin tied onto an outside staging, and the enclosed space is heated with salananders burning coke. Sometimes it is possible to use steam.

"Frost is removed from work done by the use of salt and steam, and if the concrete surface is left rough it is common to sprinkle the top surface with salt to prevent freezing. In winter it is very common to put the finish on as a separate operation, after the building is enclosed, and not as an integral part of the construction, on account of the danger of freezing. After it is put on, it must be kept from freezing for the first forty-eight hours.

"The expense of protection against the weather is not very great, and good results can be so surely guaranteed that it is not usual for the writer ever to discontinue work on account of cold weather.

"Occasionally, however, it is necessary to make some provision for the protection of the men. Shelters or windshields are built in front of the benches where carpenters are making up forms, as well as around the men at the concrete mixer, whose work does not necessarily keep them warm. Where excavation is going on in the open, it is expedient to have a building with a good fire where the men can warm themselves when necessary; and on a few jobs it has proved to be wise to furnish hot coffee free in these shelters."

THE PROFESSOR DID NOT SEE THE TAPER.

By N. G. Near.

A contractor and his gang were installing boilers for a heating system in a college out west a few years ago. The main steam pipe lines were 12 inches in diameter. All drawings had been presumably carefully made by the designing engineers and draftsmen, hence the most difficult machining was performed before the materials were shipped to the job. It was discovered, however, when a certain point was reached, that a slight error had been made by the designers or the machinists, necessitating the cutting and threading of one of the large pipes.

The contractor did not have any difficulty in cutting the pipe, but he had no means for threading it. On inquiry he learned that there was a machine shop in connection with the college in which youngsters are taught the fine art of turning metals, forging, founding, etc. He carried the piece of pipe over to the shop and inquired for the "Professor." Out west everybody connected with a college is known as "Professor" or "Doctor." The young but dignified professor was quickly found by one of the students and the difficulties explained by the contractor. The instructor took the matter very seriously. He concentrated for a few moments on the problem in hand, making a visible effort to maintain his dignity before his pupils and at the same time impress on them the importance of the prospective undertaking. After due deliberation he said to the contractor, "I shall grant your wish instantly." Forthwith he clamped the pipe into the largest lathe in the shop and turned the job over to his most promising prodigy. Of course, the professor gave the matter his own undivided attention and was himself responsible for all that happened.

The contractor thinking that there were brains enough on the job to successfully produce the results wanted, believed his presence no longer necessary. In fact he was highly pleased with prospects. He left the building with his broadest smile congratulating himself the while for having fallen into such good luck. He knew very well that considerable time would have been lost had he found it compulsory to send the pipe back to the city for threading. He would now save both time and cost of express.

The professor, as I have already intimated, was young, and he also lacked experience, his sole experience having been in that very college where he excelled in turning out "exercises" as per simple blueprints, and, later, on being appointed instructor, in the supervision of the turning out of these selfsame exercises. Once in a while he had to contend with "practical jobs" that came up in and about the school and they helped considerably, but he had never been up against anything just like this. Still, it looked fairly easy to him. He had made the error of cutting a left hand for a right hand thread on one of these practical rush jobs, so naturally, he didn't repeat that error, and he carefully cautioned the prodigy to make it right handed. However, despite his caution, he did neglect to make use of his taper attachment. The thread on the other end of the pipe which he was instructed to duplicate, was in plain view at all times while the lathe was not running, careful measurements were made over this thread to assure the correct number per inch and the threaded distance was measured with most extreme caution, but neither the professor nor the boy observed the taper of the thread which is common in all pipes and present in all pipe dies.

Even the contractor did not notice the difference when the "completed job" was turned over to him by the proud professor. The face of the contractor was wreathed in more smiles than when he left the building the first time, the job having been finished with utmost promptness. "Ah," thought he, "What a cinch." The pedagogue would take no money for the work inasmuch as the school was a State Institution and such practical work "provided good experience for the students."

The contractor carried the pipe to the boiler house, laid it near where the steam fitters were working, called their attention to it and informed them that all was well, and then drifted off to other parts. The fitters were the people who discovered the error, but, not immediately. The man who first picked up the pipe remarked, "Looks like a pretty durn good clean thread, don't it Jim? Guess we won't have no trouble here." They didn't like the way it screwed in, however. It went in easily up to the point where the thread ceased and there it stopped abruptly. Certainly, this joint would never be tight.

The contractor was advised. At first he wouldn't believe it, but on being urged, he walked over to take a look at it himself. He came, he looked, he understood, he swore. A properly threaded pipe was telegraphed for ultimately, the other having been spoiled and no other piece on hand of suitable length. To be sure the contractor advised the instructor of his error, but refrained from hurting the feelings of the young man. He had the good taste to inform him on the Q.T., thus enabling dignity to be upheld, and to be fair to the instructor, I will add that he "confessed" his error to the prodigy and all others concerned to prevent a recurrence.

EFFECT OF BOILER GRAPHITE.

By C. T. R.

EVERYONE knows that to some extent all waters used for feeding steam boilers contain impurities, either in suspension or in solution. Everyone knows, too, just what happens when the impurities collect on the boiler shell and tubes in the form of scale or soft mud, in sufficient quantities to affect the steaming properties or to even seriously imperil the safety of the boiler. The explosions about which we read so frequently are nearly always caused by the failure of a scale-clogged tube, or a scale-incrusted plate that has warped to the point of rupture, or to an unsuspected crack in the shell that had been concealed by scale. The fight against scale is being stubbornly waged.

Effects of Scale.

The effect of scale in a boiler ordinarily is to reduce both its steam-generating capacity and its economy, since scale is not a good conductor of heat and, therefore, diminishes the transmission of heat through the boiler plates and tubes. Scale is also highly dangerous, for whenever it accumulates to any great extent at a part of the shell exposed to the flame or to very hot gases, it prevents the cooling action of the water from protecting the metal against burning. The plates frequently become overheated and weaken so as to "bag," crack, and cause an explosion.

Scale Removal.

Since nothing has been found to absolutely prevent the formation of scale, the only logical thing is to employ some means to easily and safely remove the scale that does form. Flake graphite has been used for this purpose for many years, and with gratifying results. The action of graphite is not chemical; it does not dissolve the scale, nor does it attack the metal; neither is it affected by acids in the water or by the heat generated in the boiler. The particles of graphite simply work into the minute cracks existing in the old, hard scale and gradually penetrate between the scale and the metal. The scale thus loosened may be rapped off or removed otherwise without trouble.

It must be understood that if the scale is very hard and thick it may require as long as three or four months for the graphite to loosen it, but once removed, scale can never adhere firmly to the metal again as long as the graphite treatment is continued. Graphite also becomes thoroughly intermixed with new scale as it forms, rendering it soft and crumbly. In short, graphite makes boiler cleaning positive and easy.

It's use minimizes the time and power lost while cleaning; increases efficiency of heating surfaces; reduces fuel consumption; minimizes repairs; improves operation of feed pumps and water meter, and prolongs the life of boilers.

The action of graphite is purely mechanical. It may be used in any feed water and in any type of boiler. It will not evaporate or dissolve. It cannot cause "foaming," nor under normal conditions can it pass from the boiler with the steam and thereby render it unfit for industrial purposes; for this reason, it finds special favor in ice plants, laundries, breweries, sugar refineries, canneries, etc.

Forms of Graphite.

It is generally conceded that graphite is a satisfactory agency for the successful removal and prevention of boiler scale, but careful consideration should be given the grade of graphite best adapted for the purpose. Graphite as found the world over, is divided into two general glasses only—flake or crystalline, and amorphous. Amorphous graphite is valuable for certain purposes, such as foundry facings, stove polish, etc., where its properties of balling-up or sticking together in masses is not objectionable. It is a fact, however, that this form of graphite, due to the physical characteristics of the particles to a certain extent forms into pasty or mud-like masses in the presence of water in a boiler, and settles on the plates and tubes. On the other hand, experience has shown that the finely pulverized thin, flake variety of graphite will be distributed evenly on the surfaces of the shells and tubes and become more permanently attached to the metal than the amorphous graphite. This means that, pound for pound, flake graphite will give at least twice the service of the other. In other words, every particle of finely pulverized, thin, flake graphite is a scale reducing particle.

Both amorphous and flake graphite are employed, but investigation shows that those who manufacture and sell both grades, recommend the finely pulverized material in preference to the amorphous, although the margin of profit is approximately the same on both.

◆

POWER PLANT TROUBLES.

By J. E. N.

THERE is continual trouble in our power plant," said a manufacturer, "and I am at a loss to know what to do to get things going right." "That's an easy one to answer," said his friend; "remove the cause."

In many large power plants, there is often continual trouble; sometimes it is the fault of the owner, sometimes otherwise, and for the benefit of the former I will make a few suggestions, based upon knowledge gained from personal observation and experience.

Have three shifts of eight hours each, instead of the usual 12-hour shifts, and engineers would appreciate being given the same working hours as other mechanics.

If your engineers put in daily reports, get the necessary printed forms, even for moderately small plants, as it means a considerable saving of time to the engineers if they have to write up a complete report; besides, the chances are that some of the most important items will be side-tracked. It is a great help to the engineer if he has only to fill in the figures. If a blank sheet is used, the report is more than likely to be so incomplete as to be of little real value. In large plants, of course, the printed forms for the different departments are always used.

Plant owners, managers, and chiefs should understand that an occasional word of commendation goes a long way towards making more efficient and satisfied men and, therefore, less trouble. It is not always dollars and cents that count, for a little appreciation shown by the boss to the firemen, cleaners and other employees is a sure trouble chaser, no matter how faithful this class of power plant worker be.

Do not imagine that by refusing to install labor saving appliances and compelling the men to work early and late, that you are saving money and trouble. Oh no, just the opposite. You may have good men and they may do their best, but good appliances will do things better if they get proper care.

The water should go through a purifier before it goes into the boiler, a proceeding which will save your men some work, and incidentally increase the power of your heretofore partly scaled boilers, on the same amount of or less fuel.

A wonderful trouble eliminator is the free use of recording instruments for gases, water, steam, vacuum, draft, electric power, etc. They help the chief and often prevent trouble among the staff by showing up the careless or incompetent man. They will show where losses occur, and their advantages are altogether too numerous to mention.

It is not always the chief or his men who make trouble in the plant. Sometimes the owner, manager, or superintendent is the nigger on the fence, by giving orders to the men over the chief's head or interfering in other ways.

There are other trouble makers, but the foregoing corrected, will make those that remain more easily solved.

READERS' QUERIES.

Leaky Oil Ring Bearing.—In reply to the oil ring bearing query of George Munro, on page 429 of the Oct. 30 issue of Canadian Machinery, I am of opinion that the bearing is worn, leaving, thereby, too much play, and the only remedy is to have a new one. A somewhat similar case arose in my own experience, and was treated as above advised, with the result that the trouble disappeared.—R. W. Philip.

* * *

Raising Steam Electrically.—I have a battery of eight return tubular boilers under my charge, each unit of which approximates a 200 h.p. rating. Coal is the fuel we use and the steam generated is employed for drying purposes only. Our power requirements are met by a hydro-electric installation which produces at a very low cost and leaves us with 750 h.p. to spare. I would like to know if it is possible to use this excess electrical power for steam generation purposes in one or more of our boilers, and to have some data covering equipment details of any such arrangement at present installed.—T. P. Matthews.

◆

Presentation.—A presentation of a beautiful chair and cuff links was tendered Mr. Chas. W. Hawthorne, superintendent of the Bloom, Billet and Rod Mills of the Steel Co. of Canada, by the employees recently. Mr. Hawthorne expressed his surprise and appreciation in an able speech of acceptance, in which he hoped they would all be together as friends for an indefinite number of Christmas seasons.

DEVELOPMENTS IN MACHINERY

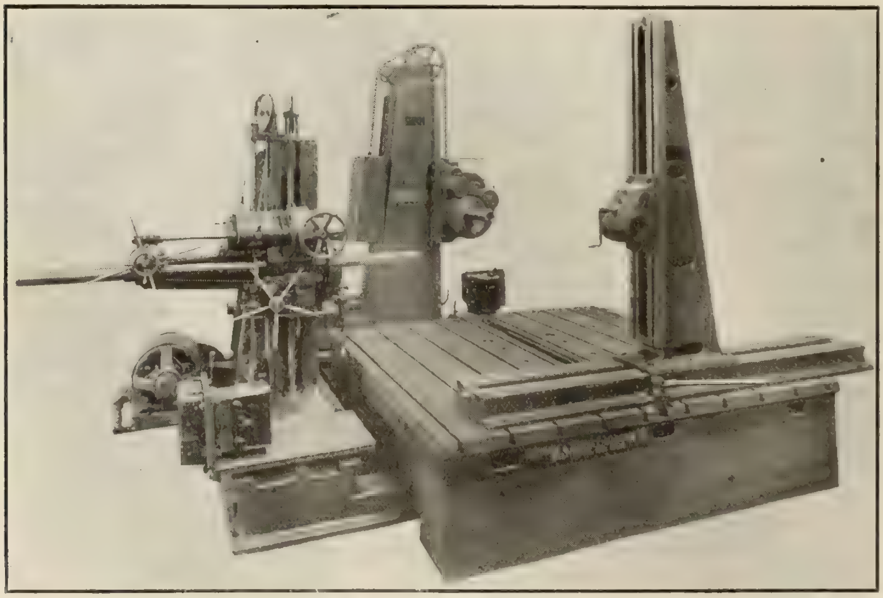
A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

DUPLEX FLOOR BORING AND DRILLING MACHINE.

FOR boring and drilling heading machinery frames and handling similar work, the Detrick & Harvey Machine Co., Baltimore, Md., has brought out a Duplex Floor Boring Machine, which consists of one of the builder's standard No. 2 horizontal drilling, boring and milling machines, with a spindle saddle having a vertical travel, set at right angles to it. The runways of each machine are bolted to bed plates of any desired size and in the accompanying engraving the bed plate is shown raised to permit the spindles to be brought close to it, the distance between the spindle in its lowest position and the work bed being about 13 inches. The columns travel horizontally on the runway, the exact amount being varied in accordance with the requirements of the purchaser. The boring of the work is accomplished at a single setting and the milling, drilling, tapping or other operations can be performed on four sides with only a single additional chucking. Conveniently located levers, arranged so as to be non-conflicting, control all movements both fast and slow, of the two machines.

The spindles, which are 5 and 3½ inches in diameter respectively, are of high carbon hammered steel and are driven from the front or working end. The spindle on the No. 2 machine has a continuous feed of 36 inches, while that for the spindle on the other machine is only 24 inches. Automatic milling feeds are provided for both machines and there is an outer support for the boring bar on the No. 2 machine.

The combination is arranged for motor drive to a 10 h.p. direct-current adjustable speed motor, a range of 2 to 1 being used. All of the gears are of steel or bronze, belts having been entirely eliminated.



DUPLEX FLOOR BORING AND DRILLING MACHINE.

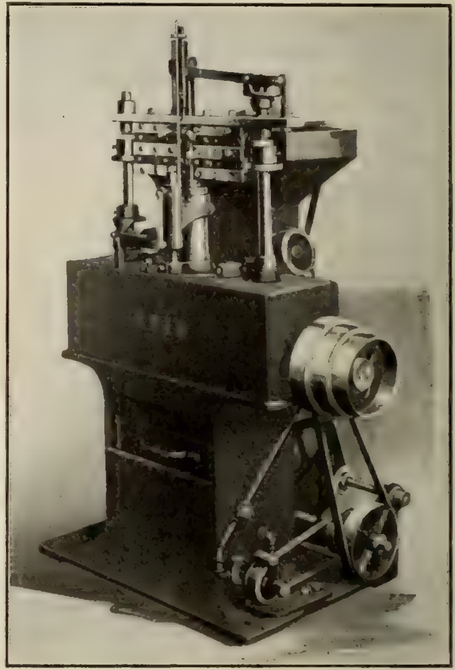
AUTOMATIC NUT TAPPER.

THE Automatic Nut Tapper here described and illustrated is a recent product of the Erie Machine Shops, Erie, Pa. This machine has no reverse motion and takes care of the tapping of units of various kinds and sizes up to 1 inch diameter. The units pass on and over the length of the tap and down through the hollow shaft to the pan below.

The tap is stationary and is held in position by two pairs of grips, opening and closing alternately to permit the nut to pass between, first, the upper, then the lower pairs. The nut passes onto the blank end first; one with a hole too small cannot get on.

The grips are of tool steel, secured to the inner end of machinery steel guides with an adjusting screw behind them to centralize the tap and to adjust for the different sizes. On the outer end of the guides or grip holders are tool steel rolls bearing on and operated by tool steel cams which are mounted on the two outer vertical shafts. There are no levers, the cams acting directly behind the grips, assuring absolute rigidity of the tap.

The nut chuck is of tempered tool steel, and revolves around the tap. It has a hole through its length the shape of the nut to be tapped, and a trifle larger. It has a vertical motion and is contained in a casing driven by a hollow shaft. At its end are a pair of grips; the grips opening when the chuck is raised above the casing containing it. The nut is then placed in the chuck by means of an arm and lever operated by a cam on the top end of the right hand vertical shaft. Immediately the chuck starts down, the grips close above the nut, carrying it down until there are sufficient threads in it to relieve the tap of its heavy duty. It then rises for another. Meantime, the chuck is sufficient in length to continue to drive the nut which is being finished.



AUTOMATIC NUT TAPPER.

The number of threads the nut passes over on the tap before accepting another, depends on the class of work to be done. Twenty-two or twenty-three threads appear to be about right for the machine screw nuts with a full thread. For shallow threads, as in the case of stove bolt nuts, etc., the nut does not have to pass so far onto the threaded portion of the tap before accepting another, thus increasing the output without increasing the nut speed on the tap. The capacity, however, depends on what the tap will stand.

The feed is a conveyor belt travelling over the top edge of the hopper at an angle of 15 degrees. The nuts raise from the hopper on a lift and slide onto the conveyor belt. Sufficient room is provided for those that do not land flat to either right themselves or be pushed back into the hopper. Hexagon nuts are handled with the same regularity as it does the square. As in the case of all automatic machinery where there is no one immediately at hand to guard against mishaps, safety devices are very important, and these have been carefully considered.

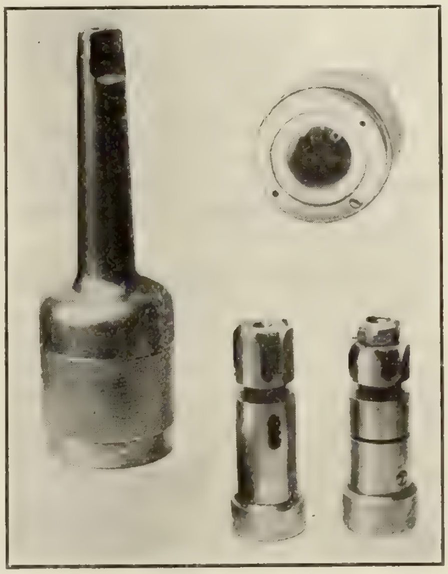
The nuts are pushed out by the conveyor belt until the foremost one is directly over the top and blank end of the tap where it rests on a pair of hinged plates held in place by two small balance weights until the starter or arm bears down upon it. The chuck driver is operated by a lever and cam on the lower left hand vertical shaft. Attached to it is a small connecting rod operating a latch which holds the starter in its topmost position, and only trips it when the driver has started down with the chuck and nut onto the threaded portion of the tap. If it should fail to go down, the starter ceases operation.

In the right hand worm gears driving the vertical cam shafts, the thrust comes on the pulley end of the driver. The pulley is secured by a feather key. On the outer end of it is a thrust washer, strong enough to drive the vertical shafts, but of sufficient weakness that if a nut with a ragged hole should land on the square of the tap between the grips as they close, the two shafts would stop simultaneous. The thrust washer will break before stripping the gears. The shaft is drawn out of the pulley until the key releases it and it runs idle. It is only necessary to dislodge the nut, push the shaft back in place, and replace the washer.

All shafts run in phosphor bronze bushings.

AUTOMATIC QUICK CHANGE COLLET CHUCK.

NEW and distinctive features of the Automatic Quick Change Collet Chuck, built by the E. Horton & Son Co., Windsor Locks, Conn., from the invention of Oscar F. Bergsten, Worcester, Mass., comprise the self-alignment of each collet on the tool steel centre, the drive independence of the retaining or locking device which results in a positive solid drive, and a locking device strong enough to enable undercutting tools to be used.



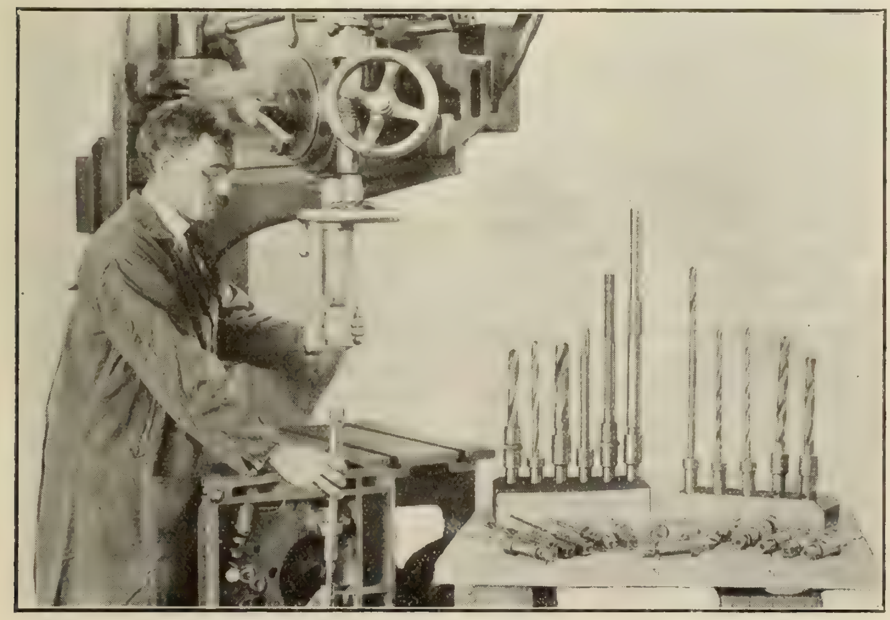
AUTOMATIC QUICK CHANGE COLLET CHUCK.

The chuck body is made of a single piece of high carbon steel, the shank being ground true with hole, and having a hardened tool steel centre in head of body. A hole is made through the shank, so that this centre can easily be driven out and replaced. The drivers are made of tool steel, hardened and ground, and will drive backward as well as forward. The locking device consists of a hardened cam, attached to a releasing collar, operating on two retaining dogs, made of tool steel, hardened and ground, and which positively locks socket when inserted. Collets can be inserted or released quickly by a slight resistance to the collar by the hand, while the machine is in motion.

The collets have a square positive drive, and are made of crucible steel, hardened and ground .013 in. smaller than hole in chuck, except centre collet, which is made to fit snugly. A cone is made in head of collet, to fit the tool steel centre of chuck.

The friction drive tap collets have a tool steel friction sleeve, hardened and ground, operating on two internal fibre cones, which give a sensitive and perfect adjustment. Blank collets are furnished unhardened, making it possible to fit them to any tool desired. All working parts are enclosed and protected from dust, and held in their proper relations by an adjusting nut at bottom of chuck. The design is such that it is impossible for operator to be injured.

Operation of chuck is effected by grasping the knurled collar and holding it back against the rotation of the spindle. This causes a pair of retaining dogs to be drawn back into the body of the chuck so that the collet can be slipped into place. The knurled collar is then released, and the action of a spring forces the dogs inward, so that they engage a groove in the collet and secure it in the chuck.



AUTOMATIC QUICK CHANGE COLLET CHUCK.

LUBRICATING GREASES

THE introduction of ground asbestos as the basic material has been an important development in the manufacture of lubricating greases. A process is patented by the Railway Asbestos Packing Co., Sherbrooke, Que., who have met with much success in the sale and manufacture of spedolene for automobile and motor trucks, axolene for axles, and asbestolene for gears of all kinds of heavy machinery and wire cables.

The greatest advantages claimed for these lubricants are that they last more than twice as long as the average grease, due to the high wearing qualities of asbestos. Since the management of the company was taken over by Mr. J. A. Tate, the business has greatly increased, and to-day their products are being sold all over Canada and the United States, as well as in Cuba and South America.

ENAMELING OR COATING STEEL AND IRON WITH GLASS.*

By Raymond F. Naylor.

(Continued from last week.)

In the production of acid-proof apparatus, the use of a ground coat or cover coat is now eliminated and the same material which in place of being an enamel, as commonly termed, is in reality a boro-silicon glass and without the use of any metallic oxides in its compounding.

The mill additions together with the agents used in "setting up" are fused with the frit as the piece is fired. By a process similar to the above, we could compute the final composition of the enamel by taking these additions into consideration. The actual amount of material added in this case, however, is so slight and of such a nature that the change resulting therefrom is not sufficient to affect materially the composition of the enamel. When an addition of about 12 per cent. tin oxide accompanies the clay, a very significant change in the composition of the enamel is produced.

Color Production.

It may be well to note in passing some of the means by which various colors are produced in the enameling industries. It will be impossible to enter into great detail without taking too much time, but the mention of certain compounds in connection with the colors produced by their use will serve our purpose.

The production of a good white enamel either for cast-iron or sheet-steel work may be said to depend, at the present time, upon the use of tin oxide. Great have been the efforts to substitute less expensive substances, such as compounds of antimony and lead, but an antimony white which looks good alone is plainly seen to be off-color when compared with a good tin oxide white. Going to the other extreme of color, black, we encounter difficulties. There are any number of formulae for black enamels, but when the results are closely compared we find that the colors range widely through brown blacks, blue blacks, purple blacks, etc. Certain compounds of manganese and iron used together give a color approaching black. Other formulae call for the combined use of oxides of manganese, cobalt and copper. Again, we find oxide of nickel added to the above three oxides.

A color much seen in enamels is blue, and the use of cobalt is very satisfactory in the production of this color in various grades of intensity. Manganese alone produces purples and violets and in combination with cobalt gives various shades of purple-blue.

Green enamels are chiefly produced by the use of cromium oxide and copper oxide, while in some cases a mixture of copper and cobalt oxide is used. Reds of various shades are produced by the use of red oxide of iron. In connection with it we find that tin oxide aids greatly in giving opacity and bringing out the color. In the production of brown enamels we may use ferrous chromate, Various yellows are produced by salts of cadmium, chromium and uranium.

The more delicate shades of rose and purple are produced by the use of gold compounds. So-called "pink-rose" is used in the manufacture of certain artistic enamels. Perhaps the best known gold compound used in enamel coloring is "purple of Casius." The exact composition of this product is a question. It is made by the combined use of auric, stamous, and stamic chlorides. The color produced is also commonly called "purple of Casius."

Future of the Industry.

Before drawing this paper to a close, attention is invited to a general consideration of the future of the enameling industry. Neglecting art enameling and sign making we come to the field of steel enamels. So far as the cooking ware industry is concerned, the field is practically constant. Granting that the demand for that class of article is increasing, as the public becomes accustomed and educated to its use, there is an opposing tendency in the rapidly increasing use of aluminum ware. Exactly how these and other factors now balance would be difficult to ascertain, but aluminum is a metal and its metallic properties cannot be denied. Under certain conditions it is attacked by various substances used in the culinary arts and a contamination of the preparation is inevitable.

No doubt the time will come when a high silica enamel known to be free from tin and other poisonous compounds will enter the cooking ware field. The Government is becoming more and more careful in protecting the public from foods of injurious nature and it is not too much to expect that soon it will establish more rigid restrictions relative to the ingredients entering into the manufacture of apparatus in which food is to be prepared. At such a time an enamel coming up to requirement will be free from injurious compounds and will come into great demand.

In the preparation of foods on a factory scale, we find an enormous and constantly increasing demand for larger pieces of enameled steel apparatus in the form of pans, kettles, tanks, pipe, etc. There are many lines of pressure being brought to bear both by the government and public opinion which lead to the conclusion that the increasing demand for this style of apparatus is without limit. Canning and preserving factories and dairy establishments have found a large use for copper and tin in the construction of containers, vacuum pans, etc. The acids of fruit juices and vegetable pulps have a very marked action on these metals and the resulting contamination of the product is known to be of danger to the consumer. The use of an enamel containing tin, lead or other metallic oxides is but the first step in the right direction. The presence of these metallic oxides in the enamel renders it corrodible and contamination results. The solution is the use of an acid-proof enamel free from all such poisonous substances. In the milk industry a similar line of reasoning applies. Further compare the ease of maintaining sanitary conditions in a one-piece enamel lined unit with the trouble experienced in the use of a metal container or even an enameled article made up of composite parts between which are gaskets.

Another consideration relates to the preparation of chemicals later used in food products, for instance, baking powder. Many operations connected with the manufacture of such products have been carried on in lead or other metallic pans and the resulting contamination has given no end of trouble. Acid-proof enamel is rapidly solving this problem also.

Finally, consider the chemical manufacturing processes now carried on in apparatus of lead, wood and earthenware, necessitated by the corrosive actions of the liquors and gases involved. This includes the pharmaceutical field which alone is a matter of great importance. In all these and many other lines the use of acid-proof enameled apparatus is rapidly finding and filling a great demand. Not only does steel apparatus meet the demands of modern industries, but in case a cheaper product is desired and at the same time a heavier construction is permissible, acid-proof cast-iron apparatus has its field. The possibility for size and variety of construction is, of course, more limited than in the case of sheet-steel apparatus

In view of these considerations and many others which these have called to mind, we cannot but conclude that the use of enameled apparatus has just begun and with this extension of the long known art of metal enameling, a field of great industrial possibilities both for manufacturer and user has been opened. We may not be criticised as being over optimistic when we predict that in their ultimate stage of development the enamel industries will be ranked among the greatest of commercial activities. At such a degree of development the enameling industry will in no way deserve classification among the lost arts.

THE BRITISH CONSULAR SERVICE.

AMERICAN consuls in foreign countries keep their eyes open for opportunities for trade, and their observations are invaluable to United States manufacturers. Time and again their reports, showing new markets all over the earth, are published, and make interesting reading. They invade Canada and, perhaps more discreetly, put their countrymen in touch with trade conditions in the Dominion from one end to the other.

Canadian manufacturers must feel a little sore sometimes, that such an organization is not at their service. The truth is, there is such an organization, and a better one. It is the British Consular Service. Recently, at the invitation of the Canadian Premier, J. Joyce-Broderick, newly appointed British Consul at Amsterdam, formerly Vice-Consul at New York City, toured this country, delivering addresses before Canadian Clubs on the relation of the British Consular Service to Canada. As he pointed out, it will be some years before the factories and mills of this country over-take home requirements, but the day will come when Canadians will require an effective consular service. He had noticed while in New York, he said, that few Canadian manufacturers made enquiries for commercial information.

Canadians are apt to forget when it comes down to business, that their country is part of the British Empire, and that the consul at New York is acting for them just as much as he is acting for English, Scottish or Irish firms. It will be good for our manufacturers who are exporters, to keep this fact in mind, and to remember that the consular service reaches out and finds new markets all over the world.

◆

MACHINE TOOLS FOR TECHNICAL SCHOOLS.

SOME time ago we drew attention to an instance where the Dominion Government was hampering technical education. The Toronto School Board had ordered certain machine tools. Some of these, it was alleged, could not be secured in Canada, and had been ordered through Toronto agents from the United States manufacturers. When the time came for the installation, it was discovered that these tools were held up in the Customs, and could not be delivered until duty had been paid. A deadlock ensued, the agents not wishing to pay the duty, as their price having been based on an understanding that machine tools required for educational purposes were allowed to enter the country duty free. As it was essential that the machines be delivered at once to allow students to pursue their studies, a compromise was arrived at between the agents and the School Board.

From the point of view of Canadian machine tool makers, the action taken by the Hon. J. D. Reid, Minister of Customs, is a favorable one, since it will result in an effort on the part of the School Board when ordering equipment for the new technical school, to choose only machine tools made in Canada. It is claimed, however, by the school authorities, that while they desire as far as possible to purchase Canadian-made tools, certain machines cannot be purchased here, and must be imported. In any case, as far as the machines ordered last summer are concerned, the matter is closed.

Some pointed remarks were made, and considerable indignation evinced at the meeting of the School Board last week when it was announced that the Minister of Customs positively refused to admit machine tools for the school, duty free. The chairman said: "Those people are trying to handicap the work that the Technical Commission are trying to build up." He added that the same machinery had been allowed to enter Winnipeg, duty free, simply because the customs officials there had put a different interpretation upon the relative clauses.

There was some talk of asking local members of parliament to assist in having the duty removed, but this was not pushed. If there is any city in Canada that can effect this through its members, it is Toronto. Failing that, all towns and cities contemplating the installation of machine tools for technical education must either buy in Canada, or pay the duty on imported machinery.

The action of the Government in this matter is in marked contrast to that of the Toronto Clay Products Manufacturers' Association, who promised to supply the Board with equipment if they would include a course in brick-making in the school curriculum.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Dec. 15, 1913.—The principal local event of the past week was the completion of the preliminary bore of the Canadian Northern Railway tunnel through Mount Royal. Gangs of men working from both ends met early on Wednesday morning last after fifteen months and four days of boring, the tunnel having been commenced on September 6, 1912.

Amid the gloom of present business conditions the highly encouraging annual report of the Canadian Car & Foundry Co., Ltd., issued last week, came as a pleasant refreshment. For the year ending September 30th last the company, with its subsidiaries, earned a gross total of $2,351,325. After providing for sinking fund, depreciation and all other requirements and after paying the usual 7 per cent. on the preferred stock, a balance of $1,371,653 was left available for dividends on the common stock—a sum equivalent to 23 per cent. The gross sales for the year amounted to $20,300,000, as compared with $16,500,000 last year and $12,500,000 in 1911; or an increase in business in two years of over 65 per cent. Owing to the present lull in trade activity the orders now on the books, however, are not as heavy as they were twelve months ago and business is expected to be dull during the present winter. The completion of the company's Fort William plant is, therefore, not being rushed, though matters are so far advanced that the plant could be placed in commission at short notice as soon as conditions justify such a step.

The machinery trade remains very quiet. Mussens, Ltd., who are sales agents for the Vulcan Locomotive Co., Wilkesbarre, Pa., have secured an order for four locomotives for the Dominion Dredging Co., Ltd., who will use them in connection with their contract for Section No. 1 of the new Welland canal.

The recent fall in the price of Nova Scotia Steel & Coal Co. stock gave rise to rumors last week that a fresh issue of capital was contemplated. The report has to-day been emphatically denied by Mr. R. E. Harris, President of the company, who states that they have all the funds they require for present needs.

Toronto, Ont., Dec. 16.—Pessimism pervades the Canadian steel market. Some admit it openly, and say: "Things are standing stock still, and we predict a bad winter;" others observe: "We do not join in the cry of bad times coming. We believe that business will be good again by spring. Of course, we admit business is bad just now, but—"

One of the leading agents for steel expressed the opinion this week that there was hope in the fact that in the States there had been no heavy buying for the past nine months, and no one had big stocks. "Does the same condition hold here?" he was asked. "Unfortunately, it does not," he replied. "Nevertheless, this is a factor which will determine the price of steel in the States, and also in Canada. The stocks of steel held in Toronto are enormous, especially by structural steel men."

This remark is not so true of manufacturers, especially outside of Toronto, who have allowed their stocks to drop very low, and have been replenishing them from warehouse. This has been the salvation of the steel men this year—the large sales from warehouses of steel bars.

Drop in Steel Bars.

A point of great interest this week is a drop of five cents per lb. in the price of steel bars and small shapes, Toronto warehouse, which occurred on Monday. Steel bars, structural shapes, and plates (warehouse, freight and duty to pay) also dropped five cents, last Thursday. This is the result of the drop in mill prices some time ago, the effect now being felt. A drop in the warehouse prices does not, as a rule, result in more business, as the demand there is only to fill requirements. A drop in mill prices does, as a rule, result in better business.

The people who are buying steel just now are manufacturers who can provide money for building extensions, and are using their own help to fabricate the steel. If they were busy, they would order it ready fabricated. Manufacturers who use steel are not inclined to contract for it even at present prices.

Seamless Tubes.

Tubes are one of the few steel products that have not followed the general downward tendency. The tube mills have kept pretty well filled up, and although there have been demands for lower prices, these were not conceded. There is a steady demand for tubes from warehouse all winter, but there is little demand for plates or heads. Recent inspections for Government officials have resulted in better business in tubes. The demand now is more for seamless tubes rather than of the lap weld tube.

About fifty per cent. of the foundries in Ontario are either closed or are running light, and very little pig iron is selling. It is a remarkable thing, however, that the demand for coke during the past few weeks has been good. Foundries in the city, which are mostly operating, are ordering coke freely. Most of them realize, it is thought, that deliveries being poor in winter, it will be best to get in a good supply.

Foundries Feel It.

A manufacturer of cast iron pipe returned to Toronto this week, after closing his foundry in Winnipeg, and from the look of things, expects to close his Toronto foundry for two months after Christmas. Business in Winnipeg he reported as fair, but further west, building was slacking off, and indicated a late spring opening. There is this good feature, he said, that most people in the West, in all lines, had been working off their stocks, and must buy afresh.

Asked why the crop in the West had not improved matters, he stated that if the crop last year had not been a good one, Canada would have experienced the worst year she ever had. As it was, there was enough money to tide things over.

The foundry business in Toronto, he said, had been exceptionally good up to last month, but had gradually been falling off, which was usually looked for, more or less, at this time.

There are quite a lot of small orders for machine tools. The Tube & Pipe Bending Co. of Ontario, 10-12 Croft St., Toronto, have equipped a new shop with machine tools, including lathe, shaper, drill, grinder, hack saw, blower and furnace. They made their own special bending machines.

The Massey-Harris Co. bought a lathe, drill presses and a shaper from the A. R. Williams Co. and other machinery from the Canadian Fairbanks-Morse Co. These will be used in their toolroom at Toronto. The latter also sold A. B. Ormsby, Ltd., Toronto, a milling machine. The C.N.R. have purchased several tools for their shops at Trenton. The Welland Foundry & Machine Co., makers of hoisting engines, bought several large machines. Pilkingtons', Ltd., the glass makers, who are building at Thorold, gave the A. R. Williams Co. their order for machine tools and supplies. The Computing Scale Co., off Royce Ave., Toronto, bought several tools, and the Holden-Morgan Co. bought several machines.

FINANCE DEPARTMENT STATISTICS.

THE official figures of Finance Dept. for November show a net falling off in revenue of $742,797 as compared with November of last year, while expenditures on Consolidated Fund Account increased by $1,054,298, and the Capital Account by $2,114,710. The increase in the National Debt during the month was $1,987,657. At the end of the month, the net Public Debt of the Dominion stood at $303,115,195.

For the eight months of the present fiscal year the total revenue has been $114,640,295, an increase of $4,204,920. Expenditures show a total increase of nearly $25,000,000. Expenditures on Consolidated Fund Account total $66,678,967, an increase of $7,225,731. Expenditures on Capital Account total $36,980,369, an increase of $17,770,222. A considerable proportion of the increase in Capital Expenditures is in railway subsidies, which totalled $15,114,908, as compared with $3,938,772 for the corresponding period of last year. The greater proportion of the railway subsidies have gone, of course, to the Canadian Northern Railway.

The November Customs Revenue totalled $8,101,626, a decrease of $1,372,324, as compared with November of last year. For the eight months of the fiscal year, the total Customs Revenue has been $75,001,109, a decrease of $1,033,966. The Excise Revenue for the eight months totalled $14,620,431, an increase of $526,450. Post Office Revenue totalled $7,675,000, an increase of $675,000. The Revenue from Miscellaneous sources increased by $2,627,038. One of the largest items of increase was in the Revenue from Chinese Immigration, the total amount of the poll taxes collected during the eight months being no less than $2,230,276, which means that about 4,500 Chinese have entered since April 1.

WORKMEN'S ACCIDENTS.

UNDER the title of "Falls of Workmen and Their Prevention," the Wisconsin Industrial Commission, Madison, Wis., has issued shop bulletin No. 4, reviewing accidents due to these causes. Nearly one-half as many accidents as occurred on all machines were due to falls of workmen. The bulletin covers the period from September 1, 1911, to March 1, 1913, or 18 months. Of the total number of accidents causing disability of more than seven days, 1,387, or 13.2 per cent., were caused by the falls of workmen. The distribution is as follows:

Down stairs	52
From ladders	141
From scaffolds, tramways, trestles, runways, platforms	292
Down elevator shafts	28
Into vats, bins, holes, trapdoors, trenches, etc.	105
From piles, poles, machines, boxes, etc..	127
From buildings	45
From wagons, cars and other vehicles...	204
Slipping, stumbling and jumping	393
Total	1,387

Most of these accidents were of a serious nature, 48 resulting in death, 425 in fractured bones, and 30 in serious internal injuries. In many cases, the bulletin says, these accidents might have been avoided by better shop lighting and proper application of safety appliances. Better organization, inspection, instruction of men, and more care on the part of workmen would have prevented most of the other accidents.—Iron Age.

Catalogues

The McCroskey Reamer Co., Meadville, Pa., have issued new catalogue No. 4, dealing with high grade tools and specialties for the machine shop. Some of the most prominent of those described are adjustable reamers, expanding mandrils, chucks and collets. A detailed description is given of each with illustrations showing their construction, together with principal dimensions, capacity and price. The catalogue concludes with a list of customers. B. Whittaker, 21 State St., New York City, is the export agent, from whom copies may be obtained.

The Orenstein-Arthur Koppel Co. have issued an attractive catalogue No. 900, dealing with their products. The catalogue is divided into nine parts, each describing some special product, the principal being dump and industrial cars, industrial tracks, switches and turntables, dump buckets, etc. Each type is illustrated and chief dimensions given, the illustrations being numbered and indexed in addition to the general index. The illustrations and reading matter are clear and well arranged. The Canadian Fairbanks-Morse Co., Ltd., Montreal, are the Canadian sales agents, and will be pleased to send copies to interested readers.

The Cincinnati Electrical Tool Co., Cincinnati, O., have sent us a copy of their latest catalogue No. 6, illustrating and describing fully their improved line of "Cincinnati" portable electric drills and grinders. The catalogue is arranged in two parts, part 1 being devoted to electric drills and part 2 dealing with electric grinders. All the machines are made for either d.c. or a.c. current of any phase. A specification is given covering the principal features embodied in their construction together with clear cut illustrations of the various types. Tables are included giving code word, weight, speed and capacity, etc., of each type. A partial list of users is also given. Copies of this catalogue will be mailed on request.

Samuel Austin & Son, Cleveland, Ohio, Industrial engineers and builders, have published a book dealing with the "Austin Method" of factory design, erection, equipment and maintenance, the idea back of the method being that better results can be obtained by the employment of one organization to plan and carry on the work instead of several, thus avoiding divided responsibility. The company specialize in this class of work and have three methods of handling it, according to its nature and the wishes of the owner. Each method is fully described and the book contains several excellent photographs of buildings erected under the "Austin Method." This is a handsome production, the photographs and reading being well arranged and enclosed within a substantial binding. Copies of this book will be sent to interested readers.

* * *

Sandstone, Alta.—Ceramics, Ltd., will build a plant for the manufacture of face brick, hollow ware, vitrified clay products, etc. Natural gas will be used. John Steinbrecher, president.

J. Orr Callaghan of the Steel Company of Canada, and **B. H. Prack,** of Prack & Perrine, architects and engineers, Hamilton, were in Fort William last week in connection with the Steel Co. new plant under construction.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Winnipeg, Man.— Leopold Levinson has taken over the business of Schmidt & Co., brass founders and makers of fittings.

Hamilton, Ont. — The International Harvester Co. will have sufficient work to keep its present staff at work all winter.

Deseronto, Ont.—The Standard Iron Co., Ltd., will spend $50,000 on an extension to its plant if assured of a fixed assessment.

Caledonia, Ont.—Logan & Sons are preparing plans for the erection of new machine shops and a foundry, and will require new equipment.

Toronto, Ont.—The warehouse of H. A. Drury & Co., agents for steel, was damaged by fire on Wednesday, Dec. 10, to the extent of $2,000.

Brantford, Ont.—The Massey-Harris Co. are erecting an addition to their paint room, at a cost of $3,000. A. J. Cromar is the builder.

Dundas, Ont.—Pratt & Whitney Co., of Canada state that they will not require any new equipment for the hardening room they are erecting.

Calgary, Alta.—The Trussed Concrete Steel Co., Ltd., Walkerville, Ont., has been incorporated to do business in Alberta, with a capital of $500,000.

Toronto, Ont.—The Monarch Brass Co., 278 Dundas Street, will erect a brass foundry, for which plans are drawn. James Sherlock, owner and contractor.

Galt, Ont.—The plant of the Galt Knife Co., referred to last week, is under construction. The following departments will be equipped:—Forge, grinding room and boiler house.

Kingston, Ont.—The Canadian Locomotive Co. are about to start the erection of a one-storey machine shop, costing $68,000, of steel construction. It will be 278 feet in length.

Toronto, Ont. — Fire on Dec. 9 did damage amounting to $1,000 at the foundry of Galloway, Taylor & Co., 36 Pearl St. Besides damage to the building, the motor was destroyed.

Tottenham, Ont.—The Coleman Fare Box Co., recently incorporated in Ontario, will carry on business at Tottenham in the plant formerly owned by the late J. H. Coleman, with head offices at 70 Bond Street, Toronto. A. A. Burrows, Toronto, manager.

Vancouver, B.C. — The Compressed Gas Co., Ltd., are installing large oxygen making machinery in their plants at Calgary and Vancouver. The new plant at Vancouver will be ready early next year.

Orillia, Ont.—The council has offered to lend $50,000 to a German company, give them a site, and fix their assessment if they erect a 2-storey factory 250 x 125 ft. in size, costing $50,000, and employ 100 hands.

Waterloo, Que. — Efforts are being made to induce the Bedford Mfg. Co., makers of scythes, axes, etc., of Bedford, Que., to locate here. Their plant was burned down a week ago.

Walkerville, Ont.—The Diamond Mfg. Co. advise that they have taken 5,000 sq. ft. floor space in the Power Bldg., and are equipping it with modern machinery. D. B. Lee, general manager.

Toronto, Ont.—The new plant of the National Cash Register Co., which will contain a considerable amount of machine tools and special machinery, is about two-thirds completed, and should be ready for occupation by May.

Toronto, Ont.—W. J. McGuire, Ltd., plumbers, will erect a two-storey brick factory at 91-97 Jarvis St., costing $33,000. This will be used for plumbing and heating work, and will have a large machine shop in connection.

Fort William, Ont.—As a result of the temporary lull in business, the Canadian Car and Foundry Co., will not rush to completion their new Fort William car shops, but will have them in such a state that they could be easily placed in commission.

Guelph, Ont. — The Guelph Pattern Works have recently moved into new and larger premises in Guelph, and are taking up the manufacture of snap flasks, bench rammers, and other moulding equipment. They made their first shipment last week.

London, Ont. — The Grobb Manufacturing Co., Ltd., will add buildings and plant to the London Foundry costing $50,000, and employ 110 hands. Voting on by-law, Dec. 29. They have orders in hand for $90,000 worth of product, and will use 75 to 90 h.p. Hydro-Electric power.

Port Mann, B.C.—The foundations for the Canadian Northern Railway machine shops and roundhouse are being rushed, the Imperial Construction Co. having 200 men at work. Foundations for the roundhouse are practically completed. A new wharf will be finished in a week or two.

Hamilton, Ont.—D. M. Cameron, president of the Cameron Island Syndicate, Ltd., has an option on the plant of the defunct Hoeffner Refining Co., for the erection of a smelter to obtain cobalt from the ore now being discarded at Cobalt. Tests are now being carried out by the Dominion Government.

Halifax, N.S.—The Nova Scotia Car Works have received several orders and the plant will start up immediately. The orders given are sufficient to keep the works in operation till the middle of March. Work on the foundation of the new foundry has been finished and the structure will be pushed as fast as possible to completion.

Montreal, Que.—Geo. A. Savage, curator, will receive tenders up to December 26 for the purchase of the material and supplies, machinery, rolling stock etc., separately or en bloc, of the Amesse Foundry, 144 Wellington St. Curator at 232 St. James Street.

Winnipeg, Man.—Good Roads Machinery Co., capital $200,000, was incorporated in Manitoba last week. Provisional shareholders: William Ernest Clark, manufacturer; James Smith, ditching contractor; Benjamin Clement, mechanical engineer; all of Winnipeg.

Preston, Ont.— The Metal Shingle & Siding Co., advise that they already have a fully equipped plant at Saskatoon, which they intend to enlarge, though perhaps not until things improve. Some machinery will be required next year for the manufacture of specialties. C. Dolph, Preston, president.

London, Ont.—The George White & Sons Co., London, Ont., makers of agricultural and general machinery, have just completed the erection of a repair department at Moose Jaw, Sask. They will build a warehouse there next spring. This branch will ultimately be equipped for assembling and repairing.

Weston, Ont.—The Toronto Structural Steel Co. have practically completed their plant here, and expect to start operations on the first of the year. They make steel buildings, bridges, etc., and have orders for three months' work. Mr. Nicholson, general manager. The Toronto plant will be retained for city work.

Windsor, Ont.—The Remington Arms-Union Metallic Cartridge Co., who are erecting a new plant here advise that much of their new equipment will be furnished by their Bridgeport plant. As regards regular machine shop tools, they are unable to anticipate future requirements at present. Chas. A. Bradley, Gen. Mgr.

Fort William, Ont.—The city has agreed to have the cast iron pipe ordered for next summer, manufactured immediately by the Canada Iron Corporation. This order consists of 1,600 tons, ranging in size from 8 inches to 18 inches, costing about $72,000. This will enable the plant, which was to be closed down for the winter through lack of orders, to continue operation for a few months.

Bedford, Ont.—The Bedford Mfg. Co., Bedford, Que., makers of scythes, axes, etc., whose plant was recently burned, advise that pending the rebuilding of their plant, they have arranged with other manufacturers to take care of their orders. Their handle manufacturing department was saved. They will erect a much larger plant in Bedford. F. D. Walsh, manager.

St. Catharines, Ont.—The Russell-Jennings Co., an American concern, makers of augers, auger bits, and other tools and hardware, have purchased the old Spring Factory on Vine Street, and will build a plant having a payroll of $10,000 annually. The factory will be enlarged. The council have given the first reading to a by-law granting them a fixed assessment of $2,000 for ten years.

Woodstock, Ont.—The Concrete Machinery Co. are asking the city to lend them $20,000 to concentrate their business here, and extend it for the manufacture of new lines. The Companies to be amalgamated are: The Mitchel Crusher Mfg. Co., Toronto, and The Woodstock Windmotor Co., Woodstock. The new concern will be capitalized at $150,000. Voting on the by-law takes place Jan. 3.

Sault Ste. Marie, Ont. — Notice is given of the surrender of the charter of four subsidiary companies of the Lake Superior Corporation of Sault Ste. Marie. These are: The Algoma Steel Co., the Algoma Commercial Co., the Sault Ste. Marie Pulp & Paper Co., and the Algoma Iron Works. All these companies have been consolidated in the new Algoma Steel Corporation, whose charter is wide enough to enable the operations of each to continue and accordingly the old charters have been surrendered.

Sydney, C.B.—The Dominion Iron & Steel Co. is preparing to instal a new heating furnace in their rolling mill, with a view to developing an output of soft steel in addition to the many other products manufactured at the works. It was at first intended to establish a number of extra soaking pits in the blooming mill, but it was finally decided to adopt the furnace idea for the soft steel production. New tables are also to be put in the rolling mill. These and other preparations are to be undertaken in order to meet an anticipated large demand in the immediate future for the company's products.

Midland, Ont.—The Midland Malleable Iron Co., Ltd., advise that they will erect a plant, 100 x 500 ft., of reinforced concrete fireproof construction; walls 18 ft. high, with roof of corrugated asbestos material. It will be completed by February 15, and will employ 150 hands. Plans are now being prepared. The equipment will consist of specially designed 15-ton and two 24-ton annealing ovens, a core oven, with 300 sq. ft. rack space, and eleven machines, including tumbling mills, grinders, band saws, rip saws, lathes, drill presses, forges, moulding machines, and electric motors for individual drive throughout. H. Kreitner, manager.

Electrical

Ayr, Ont.—Ayr council has signed an agreement to take Hydro-Electric power.

Brampton, Ont.—The question of the new fire alarm system to be installed next summer is being discussed.

Waterloo, Que.—The Brome Lake Electric Power Co. have asked the corporation to give them a contract for ten years.

Montreal, Que.— The city will spend $9,000 on electric and gas fixtures, $6,000 on new meters, and will buy 100 alarm boxes.

South Vancouver, B.C.—The council are considering the installation of 50 fire alarm boxes of the Gamewell type, at a cost of $10,300.

Fort William, Ont.—The Kaministiquia Power Co. are at present completing an extension to their plant, bringing the capacity up to 30,000 h.p.

Calgary, Alta.— The Calgary Power Co. are now completing the installation of their fourth unit, thus increasing their capacity to 19,000 h.p.

Dundas, Ont.—Work has commenced on the construction of a hydro-electric transmission line to Ancaster. Power will be supplied from Dundas.

Quebec, Que.—The shoe factory of Tourigny and Marois was completely gutted by fire on Monday, with a loss of $200,000. Insurance $80,000.

Asquith, Sask.—A deputation recently visited Langham to inspect the electric light system with a view to installing a similar plant here.

Peterborough, Ont. — The Otonabee Power Co., urged the council last week to renew their franchise for ten years from Jan. 1. The franchise was refused.

Stonewall, Man.—The town has made a contract for light and power with the Winnipeg Electric Light Co. Light was turned on last Friday.

Calgary, Alta.—The Eau Claire Lumber Co. will instal two gas-driven electrical generator units, which will develop 1,500 kilowatts, and two large turbines at a cost of $300,000.

Prince Rupert, B.C.—The ratepayers will be asked to ratify an agreement with the Ritchie-Agnew Power Co., and to authorize the expenditure of $40,000 on a waterworks extension.

Fredericton, N.B. — The Eal River Light, Heat and Power Company have offered to supply electrical power for the public services in Fredericton, at the rate of 2 cents per kilowatt on a long-term contract.

Red Deer, Alta.— Conferences have taken place between the city and the Western General Electric Co., with a view to the purchase of the latter's plant. The city's financial position would not permit of the deal being closed.

Toronto, Ont.—The reduction in rates for Hydro-Electric domestic and commercial lighting will not take place just now, and perhaps not until the steam reserve plant has been installed. The rates for street lighting will probably be reduced.

Welland, Ont. — A by-law providing for a fire alarm system, costing about $5,000 will be submitted to the ratepayers in January. The Fire, Light and Water Committee is negotiating with The Northern Electric Co., and the Fire Protective Co. of Toronto.

Toronto, Ont.—The Hydro-Electric Power Commission has made a contract with the Ottawa and Hull Electric Co. for 20,000 h.p., for 33 years, with a graduated reduction from $14.

Quebec, Que.—The Dominion Textile Co. will erect a new mill and make a large extension to its present mill at Montmorency Falls. The work will be commenced next summer, and will cost in the vicinity of $750,000, Harold F. Mills, manager, Montmorency Falls.

Markham, Ont.—Representatives of the municipalities interested in the construction of a ''Hydro'' radial railway from Toronto to Markham and Port Perry met in the offices of the Hydro-Electric Power Commission last week, and decided to go ahead with the preliminary organization of the scheme.

Havelock, Ont.—The Seymour Power Co. offer to supply the town with power at $15 per h.p. at Healey Falls, the town to build and equip the transmission line. It is estimated that $2,000 would be required, and if the cost does not exceed that sum very much, a by-law will be prepared and voted on at the January elections.

Bolton, Ont. — The Hydro-Electric Commission has offered to supply the village with power at $44.61 per horsepower. Woodbridge and Thistledown are also anxious to get power, and the Weston Water Power & Light Co. has made a bid to the commission for the contracts and extensions in connection with the new line, as they have the nearest distributing sub-station.

Montreal, Que.— The present power house on the Lachine Canal has been found inadequate, and will be replaced by a new one, on an adjacent site, at Cote St. Paul locks. The foundation will be rushed now so as to allow completion before next summer. The machinery installed will be large enough to take care of the increasing demands of the canal. D. O'Brien, superintendent of the Lachine Canal, Montreal.

Vancouver, B.C.—The Western Canada Power Co., will raise the dam at Stave Lake, and have ordered two new 13,000 h.p. hydro-electric generating units, one to be delivered in the spring, and one in 1915. The lines of the Company now stretch throughout the Fraser Valley, and to Bellingham, Wash., where they supply 6,000 h.p. to the Puget Sound Light & Traction Co. R. F. Haywood, Vancouver, general manager.

Toronto, Ont.—The construction of a new double circuit power line between Niagara Falls and the main transmission station at Dundas, the doubling of the present line between Dundas and St. Thomas by way of London, and the enlargement of half a dozen sub-stations, all to cope with the expansion in the consumption of power, have been practically decided upon by the Ontario Hydro-Electric Commission.

General Industrial

Amherst, N.B.—The Canada Beverage Co. plant, valued at $20,000, suffered a serious loss by fire on December 6.

Calgary, Alta.—Pilkington Bros., glass manufacturers, are contemplating the erection of a plant here costing $150,000.

Fort William, Ont.—The Plymouth Cordage Co. have had representatives in this city looking for a site on which to erect a warehouse.

Toronto, Ont.—The machinery of Colby & Co., 186 Adelaide St. W., book rule manufacturers, was considerably damaged by fire on Tuesday, Dec. 9.

Granby, Que. — The Council have agreed to assist the International Tire Co. in re-establishing a plant for the manufacture of automobile tires.

Hamilton, Ont.—The National Gas Co. are negotiating for the sale of stock to the value of $175,000. The laying of pipes will not be commenced until the spring.

London, Ont.—S. F. Lawrason & Co., soap manufacturers, who were offered inducements to leave the city, have decided to stay, and expand their plant next spring.

Belleville, Ont. — M. Robinson, of Guelph, Ont., will take over the old Quinte Laundry building, and instal equipment for a creamery, to start in January.

Welland, Ont. — The Empire Cotton Mills will erect a new duck fabric mill early in the spring, in which a new type of weaving machinery will be installed.

Woodstock, Ont.—The Canadian Oak Tanning Co., in which Thornton's, Ltd., of Brantford, are interested, will erect a plant here. They are capitalized at $100,000.

Welland, Ont.—The Toronto Cotton Mills, capitalized at $200,000, propose to erect a mill here costing $1,000,000. L. T. Decourt, Boston, is the trustee of the company.

Edmonton, Alta.—A syndicate has been formed here with a capital of $50,000, to establish a malting and brewing plant at Fort Fraser, B.C. A site has already been secured.

New Westminster, B.C.—The Pacific Chocolate Co. has been reorganized, R. L. Cliff being the new president. New lines will be manufactured and extensions made in the near future .

Toronto, Ont.—Ernest W. Gill, jewelry manufacturer, 186 Adelaide St. W., suffered loss to his stock and machinery by fire last week. P. B. Wallis & Son, leather goods makers, suffered loss in the same fire.

Vancouver, B.C.—A. L. King, Edinburgh, representing the James M. Davidson & Co. Fisheries, informed the Board of Trade last week that this firm would erect a fish fertilizer plant on the coast near the Skeena River, costing $100,000.

Toronto, Ont. — Damage by fire amounting to $25,000 was done on Dec. 10 to the following plants situated at 441 King street west:—Reilly Mfg. Co., $15,000; Victoria Paper & Twine Co., $7,000; R. A. Drury & Co., $2,000; and the rest to the building, owned by Lt.-Col. Cowan. The Reilly Mfg. Co., make whitewear, and their machinery will require overhauling.

Shipbuilders Going to Ottawa.—Delegates of the Canadian Shipbuilders' Association are to meet at Ottawa before the opening of Parliament, to urge upon Government the necessity of giving serious consideration to the question of shipbuilding in Canada. H. F. Bullen, of Victoria, the vice-president, will represent British Columbia; Messrs. Lindsay and Miller, of Toronto, will represent Lake interests, and Messrs. Davie and Black the Atlantic Coast. It is said that the association will have the support of the different boards of trade throughout tthe Dominion, who may also send delegates to the conference with the Government.

Refrigeration

Calgary, Alta.—A municipal packing plant, in which the C.P.R., the G.T.P. and the C.N.R. are interested, will be considered by the council early next year.

Winnipeg, Man.—The Manitoba Cold Storage Co., Winnipeg, has applied for power to increase its capital stock from $500,000 to $1,000,000 in order to increase the capacity of the plant.

Fredericton, N.B.—Arthur C. Corfield, George N. Kennealy, Percy W. Wetmore, William W. Corfield and John M. Robinson, St. John, are applying for incorporation as the New Brunswick Packing Co., Ltd. Capital, $99,000. Head office, St. John.

Wood-Working

Yarrow, B.C.—J. H. Maddaugh, Vancouver, is building a shingle mill here.

Sarnia, Ont.—F. F. McGibbon & Sons are making additions to their planing mill and lumber yards.

Plessisville, Que. — Taschereau & Frere, manufacturers of axe and pick handles, have dissolved.

Vancouver, B.C.— Foley, Welch & Stewart, contractors, Vancouver, are considering the erection of a saw mill near Newport, B.C.

Wingham, Ont. — Walker & Clegg, manufacturers of upholstered goods, will make an extension to their plant, and are asking the town for a loan.

Toronto, Ont. — The plant of J. M. Loose & Sons, Carlaw avenue, piano action makers, has been purchased by Frank Loose, who will make additions for the manufacture of pianos.

Stratford, Ont.—The Classic Furniture, Ltd., are building a plant for the manufacture of high grade bedroom furniture. New machinery is being installed.

Montreal, Que.— J. P. Dupuis, Ltd., Verdun, Que., has been incorporated with a capital stock of $300,000 by Joseph P. Dupuis, George N. Monty and others to manufacture doors, sashes, etc.

New Toronto, Ont.—A. T. and W. J. Thompson are laying foundation for a new planing mill, two-storey, 50 by 54 feet, with carpenter shop above. Five electrically-driven machines will be installed.

Chatham, Ont.—The firm referred to last week as contemplating the erection of a match factory here, is Somers Bros., Saginaw, Mich., makers of the well-known Saginaw match. The ratepayers on Monday last, voted against granting this company a bonus. Consequently they will build elsewhere.

New Incorporations

The Central Garage and Electric Co., Ltd., has been incorporated in New Brunswick to do business at Moncton, N.B. They will repair both automobiles and electrical machinery.

J. R. Baxter & Co., Ltd., incorporated at Ottawa, capital $75,000, to manufacture all kinds of hardware and machinists' supplies, etc., at Montreal, Que. Incorporators: John R. Baxter, William J. W. Booth, etc., Montreal.

P. L. Schmidt Hardware, Ltd., incorporated at Ottawa, capital $50,000, to manufacture hardware and cutlery at Montreal, Que. Incorporators: Alastair M. Fisher, John Pritchard, etc., Montreal.

Consumers' Fish and Cold Storage Co., Ltd., incorporated at Ottawa, capital $50,000, to store fish and manufacture ice at Yarmouth, N.S. Incorporators: Elmer E. Prior, Maurice P. Shaw, etc., Yarmouth, N.S.

Solo Player Piano Co., Ltd., incorporated at Toronto, capital $40,000, to manufacture, buy and sell player piano actions, pianos, etc,, at Clinton, Ont. Incorporators: Paul V. Rohl, Frederick J. Hill, etc., Clinton.

Hepworth Silica Pressed Brick Co., Ltd., incorporated at Toronto, capital $125,000, to manufacture and sell pressed silica brick, core and building sands, at Hepworth, Ont. Incorporators: James Douglas, James E. Campbell, etc., Hepworth.

Canadian Elevator Equipment Co., Ltd., incorporated at Toronto, capital $100,000, to carry on in all its branches the business of manufacturing, installing and erecting elevator accessories of all kinds, at Toronto. Incorporators: George H. Sedgewick, James Aitchison, etc., Toronto.

Tenders

Hamilton, Ont.—The National Steel Car Co. is still negotiating with the Grand Trunk for the contract to be closed next week for a thousand steel cars. The general expectation is that the Hamilton concern will be favored.

Ottawa, Ont.—Tenders will be received for the construction of the Chaudiere Falls, on the French River dam up to the afternoon of December 29th. The proposed improvements will provide for a depth of twenty feet.

Winnipeg, Man.—Tenders addressed to the chairman, Board of Control, will be received up to December 26th, for the construction of an ice-breaker and navigation fender at the Louise Bridge. Plans, specification, etc., from city engineer, 223 James Avenue. M. Peterson, secretary.

Ottawa, Ont.— Tenders in duplicate addressed one copy to the city clerk, City of Ottawa, Canada, and the other to Sir Alex. Binnie, Son & Deacon, St. Stephen's House, Westminster, London, England, and endorsed "Tenders for steel pipes," will be received until Tuesday, February 3, for about forty-two miles of welded steel pipe, fifty-four inches internal diameter, for about forty-two miles of welded steel pipe fifty-eight inches internal diameter, and about eleven miles of welded steel pipe, fifty-one inches internal diameter. Form of tender and specification may be obtained from Sir Alex. Binnie Son & Deacon, St. Stephen's House, Victoria Embankment, London, S.W., or from the City Engineer of Ottawa, Canada, on and after December 15, on receipt by them of a cheque to the value of five hundred dollars made out to the City Treasurer of the City of Ottawa, Canada, which sum will be returned on receipt of a bona fide tender.

Municipal

Cote, Sask.— The municipality will spend $12,000 on building roads. R. J. M. Parker, reeve.

Brome, Que.—The town will secure a loan to construct twenty miles of macadam road.

Port Colborne, Ont.—The village of Humberstone is in the market for a fire engine, costing $3,500.

Port Alberni, B.C. — The city will spend $40,000 on a waterworks. Voting on by-law took place Dec. 11.

Tilbury, Ont.—The ratepayers are considering a by-law to provide $6,000 for the extension of the water mains.

Quebec, Que.—The Council has voted $150,000 towards the erection of a grand stand for the Quebec Exposition.

Sarnia, Ont.—The Council have made an agreement with the village of Point Edward to supply water from its new waterworks at cost.

Wallaceburg, Ont.—The town may buy the plant of the Wallaceburg Gas Co., and will submit a by-law to the ratepayers in January.

New Toronto, Ont.—The council will instal a pumping station at the foot of Ninth street, with five miles of mains, at a total cost of $75,000.

London, Ont. — Greene, Swift, Ltd., have applied to the city for permission to lay and maintain pipes for conducting steam to the inhabitants. Voting on by-law, Dec. 29.

Fort William, Ont.—The city will raise $30,000 for acquiring and equipping a stone quarry near Mount McKay, and an extension of the street railway to it. Voting on by-law December 31.

Hamilton, Ont.—A letter from the Secretary of the Fire Underwriters' Association recommending that the pumping equipment of the city be duplicated, has been referred to the city engineer.

London, Ont.—South-western municipalities are insisting that the natural gas to be supplied by the Natural Gas Co. be purified first. The pipe lines from the Tilbury fields have just been completed.

Port Moody, B.C.—This municipality will obtain a water supply from Noon Creek, and have applied to Coquitlam Council for permission to divert part of the water from Scott Creek into Noon Creek.

Railways—Bridges

Cornwall, Ont.—The council are considering a grant of $5,000 to the Stormount and Glengarry Railway.

Peterborough, Ont.—At the January elections, the ratepayers will be asked to vote $78,000 for a bridge over the Otonabee river at Dalhousie street.

Toronto, Ont.—The new Gerrard St. Bridge will cost between $182,000 and $198,000 more than the $200,000 which has been appropriated for it by the city.

Montreal, Que. — The first train ran through the C.N.R. tunnel on December 10, carrying a number of distinguished guests. The headings were only joined on the day previous.

Edmonton, Alta.—Two parties of surveyors are in the field on the route of the Alberta & Great Waterways Railway, and construction work will begin in a few days at a point 12 miles north of this city.

Ottawa, Ont.—The St. Lawrence and Ottawa Railway will cost from $7,000,000 to $8,000,000. Work on the Brittania line will start next summer, and on the Morrisburg and Ottawa branch in the spring.

Sarnia, Ont.—The village council at Point Edward has agreed to exempt from taxation an elevator if the Grand Trunk erects such a structure there to replace the one destroyed by fire last autumn.

Forest Hill, Ont.—The promoters of the Forest Hill Electric Railway Co. are preparing their plans for an early start in the spring. It is expected that the surveyors will commence operations within a week.

Hamilton, Ont.— The Hamilton and Mountain Park Ry. Co. have been ordered by the Railway Board to prepare plans and specifications for the reconstruction of the incline railway at Wentworth street. The work must be done immediately.

Barrie, Ont.—At a special meeting of the town council, held December 12, a provisional agreement with the Toronto, Barrie & Orillia Electric Railway Co. was adopted and a by-law prepared for submission to the qualified ratepayers on January 5. The company gets a twenty-five-year franchise and a fixed assessment of $15,000 for general taxation.

Victoria, B.C.—Eight new bridges are being built by the Government and three renewed. One at Tagun near Nelson, will cost $90,000; and will be finished by May. Hodgson, King and McPhalen, Vancouver, are contractors, and the Northwest Steel Co., Vancouver, will supply the steel. The government are contractors for a bridge across the North Thompson River, 40 miles west of Kamloops. Three bridges are being erected across the Eagle River, between Sicamaus and Revelstoke, and a new bridge is being erected at Terrace, on the Skeena River. Renewals are to take place at Clayton's Bridge at Penticton, and at Athalmar.

St. Catharines, Ont.—The St. Catharines city council has been assured by vice-president Hanna that the first portion of the Toronto-Niagara River line of the C.N.R. system will be in operation between St. Catharines and Grimsby within two years.

Regina, Sask.—The Government will guarantee $1,000,000 bonds for the Canadian Northern Saskatchewan . Railway for terminals and bridges in the city of Moose Jaw. The work is to be completed with diligence and to the satisfaction of the Government who have arranged for a union depot between the G.T.P. and C.N.R. In return the C.N.R. are to have running rights to Regina over the new G.T.P. line just completed.

Marine

West Vancouver, B.C.—The West Vancouver ferry board has approved plans submitted by Cartwright, Matheson & Co. for the reinforcement of the wharf at the foot of Fourteenth Street. D. L. 237, at a cost of $20,000.

Building Notes

Hespeler, Ont.—The city will erect new municipal buildings at a cost of $25,000.

Toronto, Ont.—Acting City Architect F. W. G. Price has been asked to prepare plans for a one-storey addition to the city hall.

Toronto, Ont.—James O'Neill, of the St. Charles Hotel, will erect a three-storey hotel at the corner of Bay and Richmond Streets.

Winnipeg, Man.—A new hostelry will be built on the site of the Leland Hotel, owned by E. J. Rochon, costing about $300,000.

Toronto, Ont.—The Dominion Bridge Co. have purchased steel in England for the Royal Bank Building, and will commence work on December 20.

Quebec, Que.—C. W. Lindsay, Ltd., piano makers, Montreal, have acquired the Houghton property on St. John St., and will build a 5-storey building.

Trade Gossip

The Swansea Smelting & Refining Co., Ltd., have surrendered their charter.

The Western Car and Equipment Co., Ltd., Winnipeg, will hold their annual meeting Jan. 13.

Vancouver, B.C. — Damage to the amount of several thousand dollars was caused by a fire on December 12 at the Lulu Island shingle mill.

Goderich, Ont.—The Goderich Planing Mill Co. will increase the size of its plant if the town will guarantee its bonds for $15,000.

The Wells Pattern & Machine Works, Ltd., Jarvis Street, Toronto, is the name chosen to take the place of Wells Adjustable Chaplet Co., Ltd.

The Pratt & Letchworth Co., Brantford, Ont., one of the subsidiary concerns of the Canada Car & Foundry Co., Montreal, have increased their tonnage fifty per cent. in the past year.

J. E. Bennett, of Ker-Ben Ltd., Almonte, is suing the Hamilton Stove and Heater Co. for balance of $2,902.32 alleged to be owing for services performed.

The Canadian Car and Foundry Co., Montreal, will close down their plant on December 20, to allow it to be overhauled. This is the first time this has been possible in eight years.

The Gray Mfg. Machine Co., Toronto, have recently received an order for three 7½ x 4½ x 10 in., high duty, outside packed steam pumps, also for six 5 x 6 in. duplex power pumps.

The Ontario Railway and Municipal Board has delivered a judgment to the effect that Toronto city engineer has the right to say what type of rail the street railway company shall lay on the streets.

The Canadian Warren Tool Co., St. Catharines, have won out in an action brought against them by a local firm of electricians for $640, for wiring done. The defence was that the charge was exhorbitant.

The Steel Company of Canada did business for the first half of the year amounting to $1,108,233, the largest in its history. Even with the unfavorable conditions of the last half of the year, the company will, it is expected, improve on the showing of 1912.

The International Harvester Co. have stocked their warehouse at Fort William with 15,000,000 lbs. of harvesting machinery, 5,000,000 lbs. of binder twine, and expect to receive more before navigation closes . These stocks will be forwarded to Western points during the winter.

The Ontario Municipal Electrical Association have organized an engineering section, which will hold meetings at intervals, at which the purchase of supplies, the organization of departments, and other technical matters will be discussed.

The Ontario Municipal Electrical Association, which is composed of officials representing the various municipalities using Hydro-Electric power, decided at its annual meeting in Toronto City Hall last week to pay the members of the Ontario Hydro-Electric Power Commission $25,000 a year.

The National Steel Car Co., Hamilton, are contemplating building a new type of street car, one with steps at the middle instead of the end. Some of the more progressive companies on the other side are using this style of street car, and the Hamilton concern thinks there should be a good demand for such in Canada.

New Locomotives.—The Grand Trunk Railway has decided to build 75 new Mikado locomotives for use in Canada and the United States. Twenty-five only will be used in the latter country. The new Mikados will cost $30,000 each. The total amount, therefore, means an expenditure of $2,250,000. The locomotives will be of the most improved type.

Montreal, Que.—A winding up order has been granted on the petition of Henry Percy Douglas against Douglas-Milligan, Ltd., agents for building specialties. Alex. Robertson, chartered accountant, and Edward M. Watson, accountant, have been appointed joint provisional liquidators. Petitioner is creditor to the extent of $96,432 in cash loans to the firm.

The Dominion Iron and Steel Co. has declared a regular quarterly dividend, payable on January 2. At the meeting of directors on Friday last, J. H. Plummer, president, stated that orders on their books were almost up to regular business. He admitted that things would be slack for two months, but believed that by spring there would be good business again.

George A. Marshall has recently opened an office at 70 Lombard Street, Toronto, as manufacturers' agent, representing Wm. Atkins & Co., Sheffield, England, makers of various brands of steel for machine tool and other services. Mr. Marshall is also handling the "Fire King" sprinkling shovel for locomotive, marine and stationary steam boiler firing, being a new line on the Canadian market.

The Independent Pneumatic Tool Co., Chicago, Ill., have recently made arrangements with W. H. Rosevear & Son, Winnipeg, Man., to sell the Thor air tools in the Provinces of Manitoba, Alberta, and Saskatchewan. A complete line of air drills and pneumatic hammers, as well as repair parts, will be carried in stock by W. H. Rosevear & Son for delivery direct to users in their territory.

The Frost Wire Fence Co., Hamilton, Ont., has for years made a practice of sending its most energetic agents for trips to various parts of Canada. The route proposed for 1915 is through Western Canada, down the Pacific Coast to the Panama Exposition at 'Frisco. "Does it pay?" some one asked H. L. Frost, on learning that the firm provided the best Pullmans and every comfort. "We don't do it for fun," was the reply.

New G.T.R. Cars.—In addition to 18 Mikado type locomotives recently received from the Montreal Locomotive Works, the Grand Trunk have received the following cars: In Canada—691 box cars, from Canadian Car & Foundry Co., Turcot, Que.; 313 box cars, from Eastern Car Co., New Glasgow, N.S. In United States—479 box cars, from Western Steel Car & Foundry Co., Hegewisch, Ill.; 286 gondola cars, from Pressed Steel Car Co., McKees Rocks, Pa.

The National Steel Car Co., Hamilton, held their second annual smoking concert at the Germania Club on December 9, at which the heads of the departments and office staff were present. L. A. Rodger, assistant secretary-treasurer, presided, and said that since operations began in January last, 3,000 cars had been turned out. Among those who took part in the musical programme were C. R. Dillon, superintendent; Michael Burns, machine shop foreman; H. Cooper, foreman of paint shop; E. I. Pooler, foreman of the woodworking department, and O. D. Southwaite, chief clerk to C. R. Dillon. Mr. Basil Magor, general manager, was unable to be present.

The Graton & Knight Mfg. Co.—Owing to the increased demand in Canada for their products, the Graton & Knight Mfg. Co., Worcester, Mass., makers of Neptune and Spartan Waterproof Leather Belting have established a branch in the Unity Bldg., 46 St. Alexander St., Montreal, where they carry a complete stock of leather belting and lace leather. They have also installed in these premises a 36-in. and 40-in. belt press, with other necessary machinery to build and repair large or small belts. It has always been the policy of this company to maintain competent repair departments in connection with its various branches, and the one connected with the Montreal branch is fully equipped to give patrons prompt and efficient service.

Personal

William Deering, founder of the Deering Harvester Co., died at Miami, Fla., Dec. 9.

P. Ford-Smith, Hamilton, sailed last week for England, where he intends to spend a holiday.

A. D. Smith, formerly with the Western Electric Co., has been appointed electrical inspector of Fort William.

Andrew Schmidt, who for 32 years has been connected with the firm of Schmidt & Co., brass founders, Winnipeg, has retired.

Peter Gordon, manager of the Tuttle & Bailey Mfg. Co. plant at Welland, left last week for Winnipeg on a business trip.

Hyman Miller, a Winnipeg wholesale hardware merchant, who died in Los Angeles in January, 1912, left an estate of $1,188,679.

H. S. Holt, president of the Montreal Light, Heat and Power Co., is in the Montreal Isolation Hospital suffering from scarlet fever.

Douglas Vickers, a member of the British firm of Vickers, Ltd., who are building a shipbuilding plant at Montreal, is visiting in this country.

Thomas Cantley, general manager of the Nova Scotia Steel and Coal Co., was at Ottawa last week with Robert E. Harris, K.C., and returned to New Glasgow at the week end.

Concerning Circulars

¶ "I had not made a personal investigation of the retail situation for a year or two," said an agency solicitor and service man, "and I thought I would go out and get a line on it as a help to preparing a trade circular.

¶ "And what do you think I found? Why, some of the retailers I saw were getting fifty and sixty circulars a day! The worst was in the grocery line, but the drug line was almost as bad. Read them? What a chance! Nine-tenths of them went to the floor and were swept up unopened.

¶ "I have had some experience as to the waste of dealer literature before, but the condition to-day surpasses anything I have ever seen. It has grown much worse in a single year. There is no doubt about it, the dealers are being frightfully over-circularized."

¶ If that is so, and of course it is, what becomes of the specious claim of "exclusive attention" made for the trade circular or prospectus? What sort of impression does the retailer get of national advertising when he sees, daily, this enormous waste of advertising effort, and compares the inflated claims of many advertisers with respect to consumer advertising with their failure to get a hearing from him, the very first milestone on the way.

¶ Multiply this waste of trade circulars by their cost, both in postage and printing, and then draw a direct comparison with the same message when put through the columns of the trade press, the standardized medium for reaching the dealer. Of course, the efficiency of the trade papers in different industries varies; but as a rule there is at least one first-class medium in each field.

¶ There are several good reasons, aside from cost, why the trade circular should not be thoughlessly used, and why advertisements to the trade should be made preferentially in the trade press. One of these reasons is that the trade press represents an organized attention and medium of publicity, comparable to a clearing-house or public market. At a certain stage in the development of an industry or business, it comes almost automatically into existence to economize the effort and cost of doing business previously being done in an unorganized way. So far from having its publicity-power weakened by the increase in its advertising pages by the apparent increase in competition between advertisers, the very reverse is true. Because with the growth of size goes the growth of income or means of improvement, and with improvement prestige and power. From either the retailer's or the advertiser's point of view, this condition is ideal in that it fixes the time, the place, and, as far as possible, the character of the advertising appeal. It makes an appointment with a high percentage of the paper's readers, and if it has a real message to deliver, keeps it.

¶ Dollar for dollar, effort for effort, idea for idea, the opportunities for cashing in are much greater in the trade press than in the trade circular. Some advertisers talk of putting more ideas and more power into their trade circulars to lift them out of the ruck and give them a better chance at the retailer's attention. Why not put the same time and effort into the trade-paper copy?

—Editorial, Printers' Ink,
November 6, 1913.

The delusion about circulars is just as fondly hugged by many machinery manufacturers and dealers, as it is by wholesale grocers and druggists.

If you want to judge fairly between circulars and good trade paper advertising just casually examine a few waste paper baskets sometime.

Many a fond father of a classy circular would be sorely disgusted if he could but witness his offspring's struggle for recognition in the cold and busy outside world.

The logical place for a practical message from a practical manufacturer to a practical prospect is in a practical paper—like this.

Rate Card and full information gladly furnished.

Canadian Business Men who have made their millions

How they did it.

Every Merchant and Business man should read the two stories that appear in the January Number of MacLean's Magazine.

The Lumber Kings of the Saguenay

being the story of the three bachelor brothers, telling how the present William Price, M.P., became a multi-millionaire. This sketch is full of interesting anecdotes and information that should be familiar to every Canadian.

The Rise of McCurdy M.P.

The Millionaire of Nova Scotia

This story shows how this young Napoleon of Finance became the head of a powerful brokerage and achieved political renown. Don't miss reading this sketch.

The other excellent articles are no less interesting to business men. In fact the January Issue is teeming with information and interest, peculiar to the Merchant, Business and Professional men of Canada.

Here are the titles of other articles that will interest you:

Culture in Business Life, by Alexander F. Eastmen, M.P.

A King in Poultrydom. A University Graduate and a School Master whose hobby has made him, by Herbert Gransford.

How it Feels to Carry Money; Money Making Fur Animals, and other features in Fiction and Romance, **Review of Reviews,** etc.

Then you must not forget the Series of Articles by Frederick W. Wile dealing with the men who are making modern Germany the greatest Commercial Nation in the world to-day. The January issue contains an intimate sketch of Von Terpitz—the man who built the German Navy.

Drop us a Post Card, tell us to enter your name on our Subscription List and commence with the January Issue.

Steel Wire Chains

Lightest, Strongest, and Best.

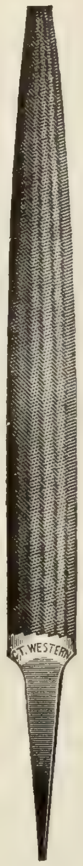
Made in thirteen sizes, from 360 to 2,250 lbs. breaking strain.

In any length or cut to size. Special Chains made to order.

Write for catalogue and samples.

THE B. GREENING WIRE CO., Limited

HAMILTON, ONT. MONTREAL, QUE.



Issue "Nicholson-made" Files

THESE brands of files sell over 200,000 a day—unique and alone in bulk of trade.

If your factory issues a Nicholson brand as your shop file, your workmen are insured almost unvarying high-quality filing. The action and "feel" are constant and unchanged from lot to lot of Nicholson-made files. Each file that reaches you is hand-tested.

Besides that, special steels, special machines, and special hardening methods exclusively Nicholson, give the greatest file value your money can buy. At all jobbers.

Nicholson-made Brands: American, Arcade, Eagle, Globe, Kearney & Foot.

NICHOLSON File Company

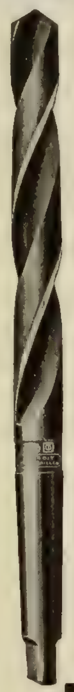
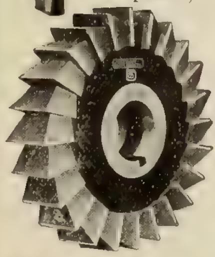
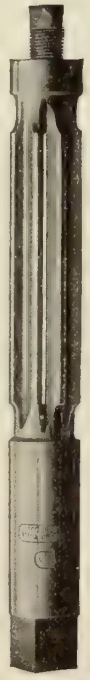
PORT HOPE CANADA







—fast—deep—clean

accurate drilling

Trade Mark

drilling that eases up the run on those tough jobs; drilling that cuts production cost by cutting out unproductive labor; drilling with drills whose perfectly central webs, equal lips, carefully milled grooves and sturdy, speedy, easy-cutting qualities insure economical hole making—that's drilling with

"Detroit" Twist Drills

Fix the trade-mark, our guarantee of satisfactory, economical service, in your mind's eye. Then when you need some tools for a hard job—a job that demands endurance, a steady cut, and ability to stand high-speeds, order "Detroit" Drills.

Write for Catalog "R."

Detroit Twist Drill Co.

Improving Twist Drills Since 1886

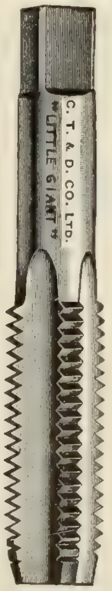
Detroit 644-656 Fort St. Michigan

Sold by

E. B. Plewes, 120 Lombard St.,
Winnipeg, Man.

Walkerville Hardware Co.,
Walkerville, Ont.

The Foss & Hill Machinery Co.,
344 St. James St., Montrea . 408



Economy in Taps

doesn't mean buying the cheapest, poorest kind, that break in unexpected places and cause you endless bother and expense.

True tap economy rightfully associated with

Little Giant

whose perfect finish and fast clean cutting qualities make them easily the most inexpensive item in your equipment in the long run. And they're tempered so carefully to just the right degree, that they'll stand up and give tap service long after the other sort have ceased to exist.

BLOWER DEPT:

Don't Be a Commercial Explorer

¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable,* and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.

Where the Efficiency Engineer Was Stalled

He did big things in every department—but one. When he tackled the tumbling room and made a thorough analysis of conditions he reported that he couldn't make any suggestions for improvement.

GLOBE TUMBLING BARRELS

were the chief equipment of this plant's tumbling room. That may have accounted for the high standard of the work.

With Globe Barrels one man can attend several barrels. They can be filled, emptied and the work inspected while running. When gentle or violent tumbling is wanted the operator simply has to change the angle at which the barrel is running and while it is running.

That's all there's room for here. If you want to know the rest about Globe Tumbling Barrels write for free catalog 2.

Eight Stock Sizes—$50 to $170.

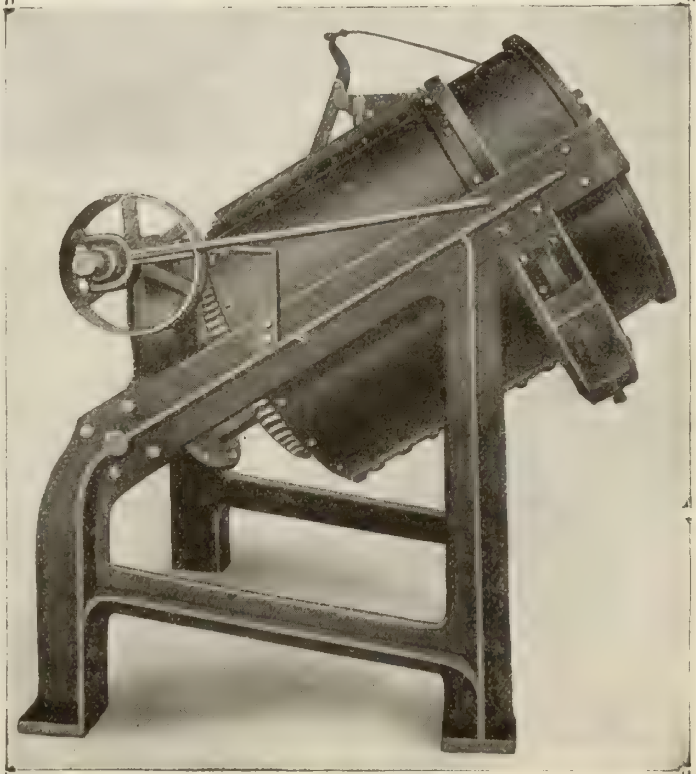
The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction



And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

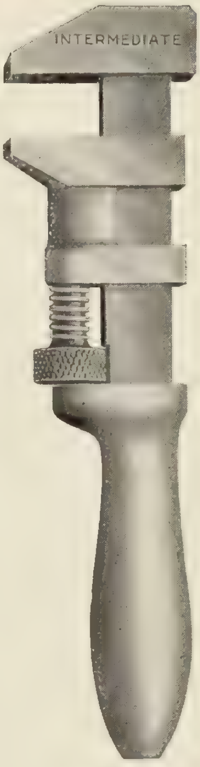
You Can Use a "W&B" Wrench Until You Lose It



"W & B" Wrenches are so carefully made that they stand all the abuse incidental to hard wrench service. The jaws are tougher than the toughest nut and will hold the bite wherever there is room to hold on to the nut. This means that you can use a "W & B" Wrench until you lose it. When you buy a new "W & B" Wrench, it'll be for some new service. Select the wrench you need from our line of 58 styles and sizes.

THE TAP WITH THE
CON-ECCENTRIC LAND
WHY PRATT & WHITNEY TAPS WIN

The Causes

One-third of the land from the cutting edge is concentric.

The remaining two-thirds has eccentric relief.

The taper-tap has a cylindrical pilot.

The taper- and plug-taps have an eccentrically relieved chamfer relieved clear from the cutting edge.

The highest grade of steel obtainable is used.

These taps are carried in stock by our Branch Offices and Agencies throughout the world.

The Results

Taps can be sharpened at the only correct point—on the face of the cutting edge.

Sharpening in no way affects their size.

Can be sharpened long after other so-called eccentrically relieved taps are rendered useless.

We obtain the freest cutting tap with the longest life — an exclusive combination.

Accuracy nowhere else obtainable is secured together with a degree of finish and refinement heretofore thought impossible in a commercial tool.

Prompt service assured to all customers wherever located.

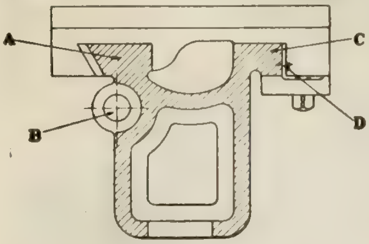
THE DRUMMOND LINES

3½-in. Centre S. S. and Boring Lathe.

By installing these lathes in the tool room to deal with accurate pieces, and in the shops for the manufacture of small parts, great economies in power, floor space and initial outlay can be readily effected.

This lathe is quite the most accurate, powerful and carefully designed tool for its size made. Note the heavy self-contained form of bed, needing no extra support, which always conforms to the inaccuracies of the floor. Note also, in lower illustration, the bed section. This form provides a square and Vee front shear (A), a long narrow guide of the most approved form—the saddle guide being immediately over the lead screw (B), which is practically central with it. The square second shear (C) takes tipping strains only, and the saddle, heaving on the top and bottom, to which it is gibbed, remains clear of the edge (D). This form of bed is not of the usual English type, but is in accordance with the most up-to-date practice.

This lathe is made in various forms, with self-contained electric motor drive, etc.



A Sensitive Drill that is also a Radial.

When installing sensitive drills, why not instal sensitive Radials? The advantages of the radial in the big sizes are obvious, so why not have these advantages in the small sensitive drills when machining small parts?

We make a sensitive radial for power and treadle that sells at practically the same price as the ordinary vertical drill. The capacity of this radial is as great as that of the ordinary drill and it will, if required, take drills up to 1-in. diam. (½-in. shank)

5-in. Centre S.S.S. Lathe for Power or Treadle.

This is an exceptionally fine lathe for repair shop and general use in places where one lathe is expected to cover a very wide range of work. The undoing of one nut allows the tool-slide to be removed, leaving a truly surfaced, T-slotted, boring table of liberal dimensions. This table has automatic cross traverse and is exceptionally useful in parallel boring.

The bed is of patent design and allows the saddle to be worked up to the largest face plate in the gap without any overhang of tool or saddle whatever.

These tools, as well as others of our manufacture, can be seen at the addresses below. Our agents will be pleased to give any information in their power concerning Drummond products.

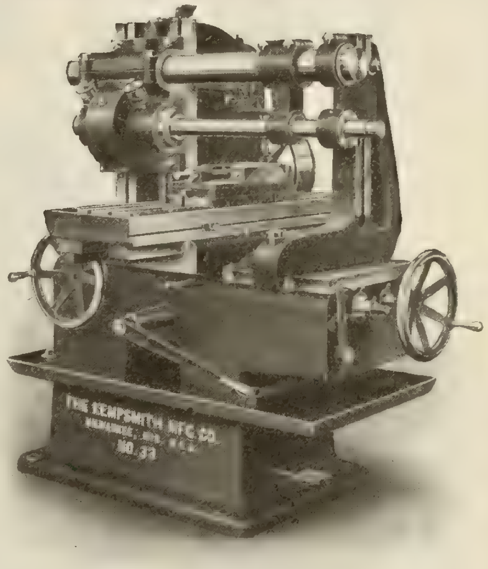
KEMPSMITH

No. 33 Lincoln



This is the latest development in the field of the manufacturing Milling Machine. Like all Kempsmiths it is designed for getting out a maximum of work with a minimum of effort on the part of the operator.

It can be belted direct to the line shaft or operated by individual motor.

One of these machines which has been installed several months in a Grand Rapids shop will pay for itself in less than a year out of the saving in wages alone.

If you are manufacturing duplicate parts in quantities you ought to send us the coupon for further information.

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 20—Safety

It is coming to be recognized more and more every day that any needed investment for guarding dangerous machinery pays a good dividend.

Public sentiment has brought this about. And law is rapidly backing up sentiment in all parts of the country.

Efforts on the part of manufacturers to protect their employees have led to some very unsightly work where pulleys, gears and belts are guarded with sheet metal, wire screens, wooden fences and every conceivable kind of make-shift.

We hold that, under modern conditions, the engineer who designs a machine and does not take into account the proper safeguarding of all the moving parts, has only partially finished his work.

Better provision can be made in the original design for protecting the running parts than can be made later by the purchaser.

It is not right that the purchaser should be obliged to improvise and patch in order to complete the work that should have been done properly by the manufacturer of the machine.

A gear, for instance, can just as well as not be enclosed in an iron frame that forms its bearings.

To leave it open means that the customer must later protect it by awkward, unsightly attachments, which often form an obstruction to keeping the floor clean.

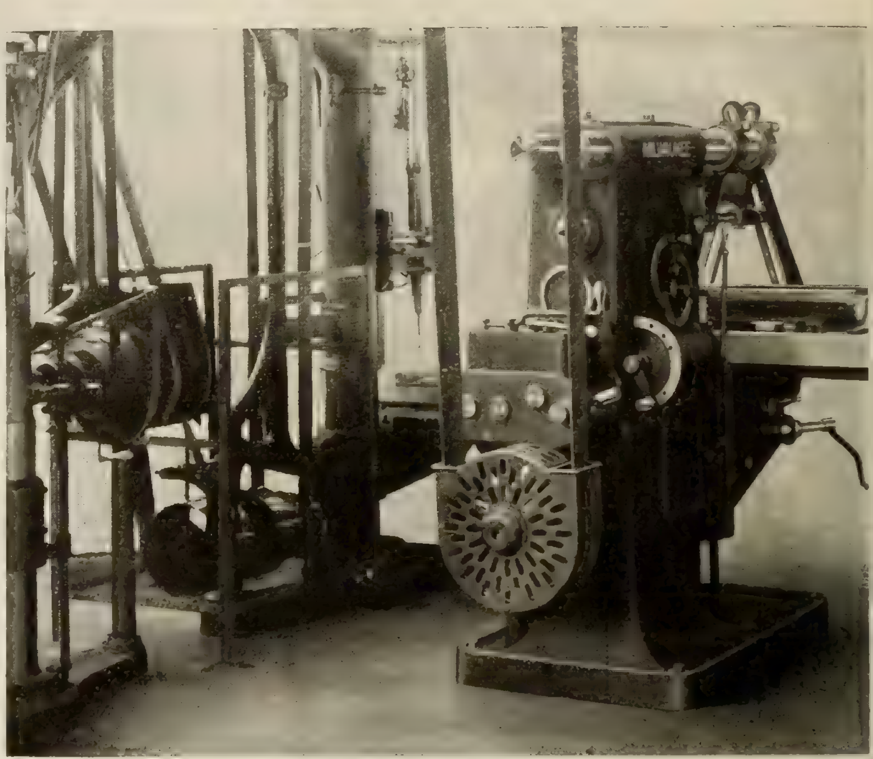
The photograph shown herewith illustrates our point.

On one side are some very well made guards on drill presses. They are as good examples as can be found of their kind. But they were erected at additional expense after the purchase of the machines, by the safety organization of the factory where they were used.

On the other side is a No. 3B Plain Milwaukee Miller. With the exception of the belt it stands exactly as it is made.

There is not an exposed gear on any part of the machine.

All the gears in the main drive are enclosed within the column, which is made oil-tight. The gears are not only removed from any possibility of contact with the operator, but they are also flooded continuously with oil, a feature which could not be secured had the enclosing of these gears not been provided for in the original design of the machine.



An extremely practical pulley guard is furnished as a regular part of the machine without a penny of additional expense to the purchaser. This guard is adjustable so that the belt running to the line shaft may be angled in any direction. To adjust the guard it is necessary to adjust only one screw.

A very important feature of Milwaukee Millers is the absence of countershaft, none being needed for any purpose, the reverse being self-contained in the machine. Were it not so, a countershaft would be required, necessitating two belts from the line shaft to the countershaft and one from the countershaft to the machine.

This goes contrary to the very self-evident truth that safety and common-sense demand the elimination of as many belts and pulleys as possible.

Countershafts are made with friction clutches that must of necessity have dangerous projections, and as countershafts are ordinarily of such construction as to require frequent oiling, this means great danger to the men when they climb up the ladders to oil.

With Milwaukee Millers no countershaft is necessary. The belt runs directly to a single pulley on the line shaft.

The care given to details of safety illustrates the thoroughness with which Milwaukee Millers are designed.

No detail is too small to receive complete attention, and all of the necessary elements are well taken care of, leaving nothing for the purchaser to improvise after the machine has been received.

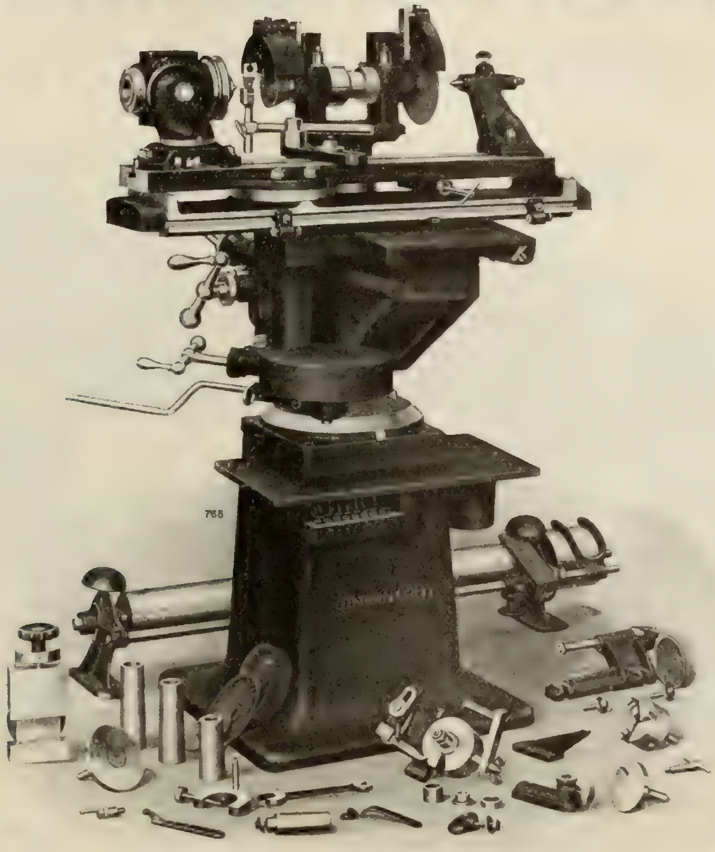
Thoroughness coupled with ability explains the success of Milwaukee Millers.

Write for our Bulletins, giving the "WHYS" in favor of Milwaukee Millers.

KEARNEY & TRECKER COMPANY, MILWAUKEE, WIS.

Canadian Agents—A. R. Williams Machinery Co., Toronto, St. John, Winnipeg. Vancouver: Williams and Wilson, Limited, Montreal.

The New Cincinnati No. 1½ Cutter Grinder



(PATENTED RIGHTS FULLY RESERVED)

Takes work 10″ diameter 17″ long. Has 16″ table travel—9½″ cross and 7¼″ vertical.
Will grind High Power face mills up to 12″ in diameter and Standard face mills up to 16″ diameter; formed cutters up to 5½″ diameter, using a 4″ diameter grinding wheel.
It is in every way as handy as our well-known No. 1 Grinder, but is much heavier and more rigid, as the illustration shows.
The following features produce quick and accurate results.

1. A vertical movement which can be adjusted and clamped without disturbing any other settings.
2. A swiveling or angular adjustment of the knee and table through a complete circle about the column which is entirely independent of all other settings.
3. A slow screw feed for cylindrical, internal and some classes of surface grinding.
4. A quick lever feed for all sharpening operations.
5. A conveniently located feed lever which the operator can set to that position handiest for the work being ground.
6. A large swiveling headstock which receives the shanks of end mills, face mills, etc., holding them for the sharpening operations just as they are held in the milling-machine spindle.
7. A graduated dial on the headstock spindle from which the clearance angle for cutters may be read direct. No clearance tables or diagrams are needed.
8. A Gear Cutter Sharpening Attachment which grinds the teeth equally, straight and radially and also *feeds the cutter to the grinding wheel radially.*
9. A single, universal tooth rest, the blade of which forms a solid support for all cutter sharpening.
10. A dial reading in degrees and also a dial reading in inches per foot for angular and taper work.

Ask for descriptive matter showing how these things have been accomplished

Garvin Screw Machines

GIVE UNSURPASSED SATISFACTION

The best materials are used in manufacturing these machines. Parts made of Krupp Chrome Nickel Steel, Drop Steel Forgings and Vanadium Steel Springs. Absolutely no steel castings used. Machines can be realigned under all conditions of wear. Spindles are of large diameter, bearings are ground and run in bronze boxes. Cross-slides fitted with plug stops, capable of fine adjustment, and can be lifted from bed without removing turret base. Hexagon Turrets on all machines, except the No. 1. Independent stops to each of the six turret holes. Our turrets and slides have long been renowned for their rigidity without cumbersomeness, the result being large output. The turret momentum is stopped by a solid plug, the lock bolt being used for indexing only. Many other exclusive features.

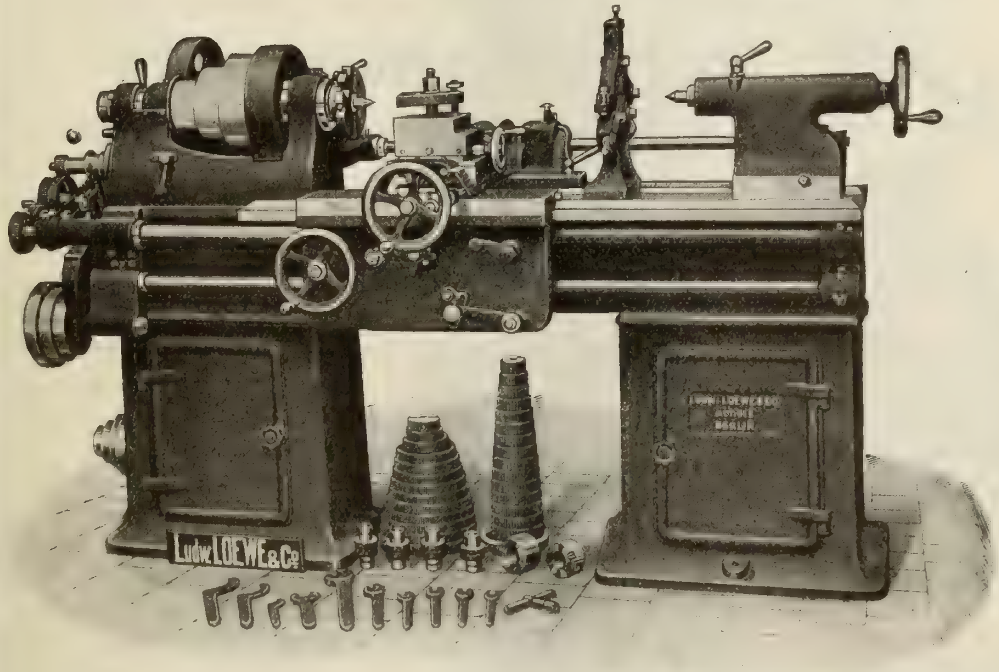
Universal, Plain, Hand, Vertical, Duplex, Profile and Vertical Spindle Milling Machines; Surface, Hole, Cutter and Tool Grinders; Die Slotters; Screw Machines; Monitor Lathes; Automatic Chucks; Screw Machine and Milling Machine Tools and Attachments; Automatic, Horizontal and Vertical Tapping Machines; Duplex Horizontal Drills; Gang Drills; Hand Lathes; Screw Slotting Machines; Spring Coiling Machines; and Special Automobile Machinery, Etc.

Backing-off Lathes

With Draw and Screw Cutting Spindle



Centre	9 in.
Length between centres	30¾ in.
Diameter of work above slide rest	6½ in.
Hollow Spindle	¾ in.
Number of teeth straight parallel	3-40
Spiral Slots	4-18

For cutting spiral shaped milling cutters of any pitch or number of teeth with a small number of change wheels there is fitted at the back of the Lathe a patented correction apparatus which, according to the adjustment of the rotating bars ("C"), controls the movement of the differential gear ("E"), and thereby also the backing off curves of the slide rest. This slide rest does not rotate, and therefore guarantees the greatest stability, even when using very broad shaping steels.

Ludw. Loewe & Co.

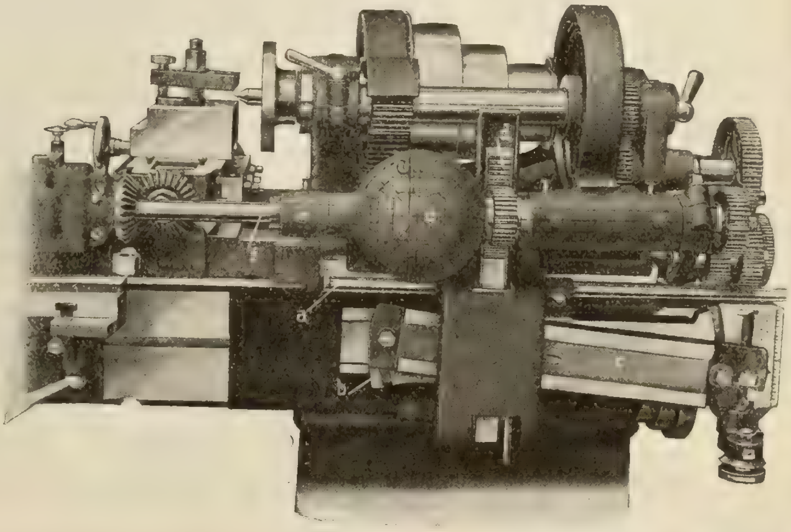
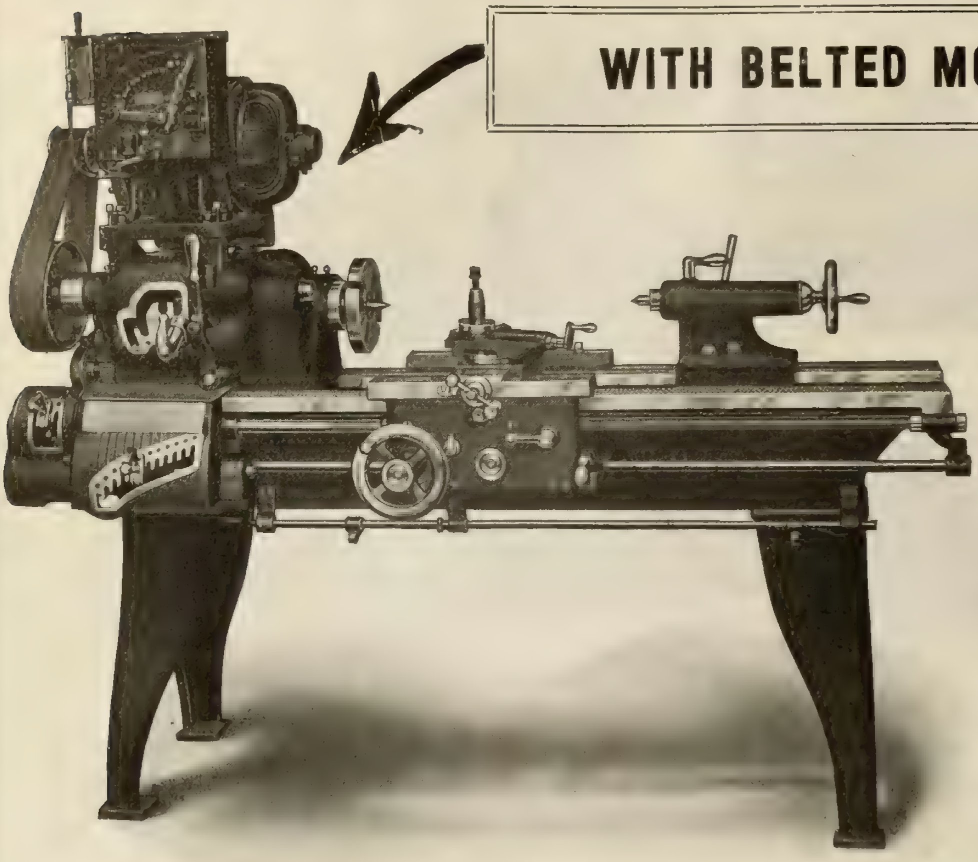
Molding and Casting of Motor Car Cylinders.



Hendey Geared Head Lathe

WITH BELTED MOTOR DRIVE



Hendey Lathes are the standard of accuracy. They mean practical economy in every tool room in which they are in operation.

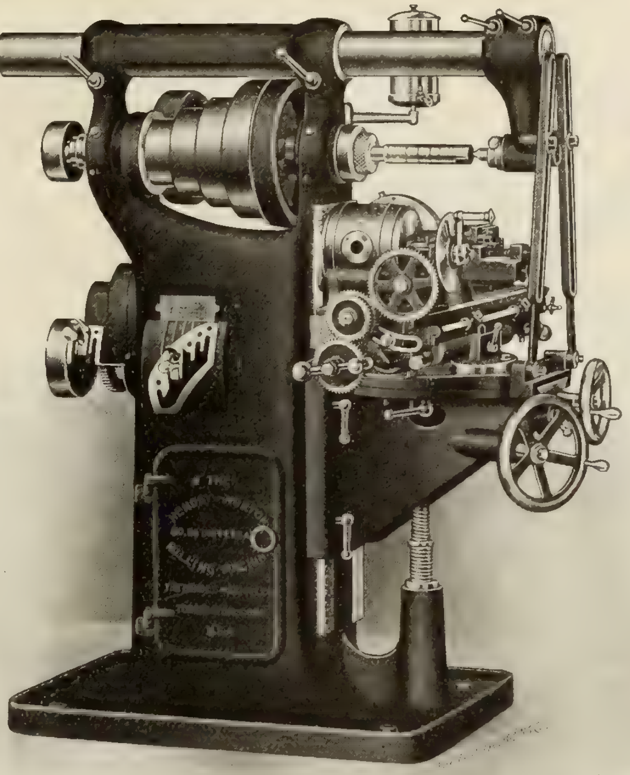
In many cases it has been found necessary to supply motor of sufficient power to meet maximum capacity of lathes. With this in our minds we have designed this **Belted Motor Drive attachment** and offered it as a **low cost motor drive.**

The work being light in character makes it convenient to use a motor of moderate power and belt for transmission in place of chain and sprocket. Motor is mounted on a hinged plate, which affords a means of securing necessary belt tension. The flexibility of the belt drive does away with the use of friction clutch equipment on power shaft, and there is also no occasion to supply guard as for chain drive. Controlling panel, as shown in front of motor, is comparatively small in size, and can therefore be attached in front of motor, where it is convenient to handle it. Drum type controller can be furnished in place of panel if preferred, and which would be attached to bed and leg, directly below head stock, in a vertical position, within easy reach of operator. Motors for this type of drive can be direct or alternating current, constant or variable speed.

The Hendey Machine Company

Torrington, Conn., U. S. A.

AGENTS:—The A. R. Williams Machinery Co., Toronto, Ont.; The A. R. Williams Machinery Co., 260 Princess St., Winnipeg; The A. R. Williams Machinery Co., Vancouver; The A. R. Williams Machinery Co., St. John, N.B.; Williams & Wilson, Montreal, Canada.



¶ We believe there are many shops which need a Universal Milling Machine of moderate dimensions, and which would find it a paying investment after they had installed one. To such a concern we recommend for careful consideration our No. 1½ machine shown herewith.

¶ They have been hesitating, perhaps, for fear that the machine with belt driven feeds is no longer useful, but has become obselete on account of the all-geared drive mechanism applied so extensively to milling machines at the present time. We assure them that this is not the case. We manufacture both styles of machines, and this **No. 1½ is a very active member of our line.**

¶ There are thousands of small cutters made and used at the present time; many of them are carbon steel. This machine is amply able to produce efficient results with the class of work on which such cutters must be used.

The **workmanship** and **materials** entering into this machine are the best.

The **Spindle Journals** and **Bearings** are identical with what we have been using with such marked success for many years in all sizes of our lathes and milling machines.

The **arm** is a Solid High Speed Carbon Steel Bar.

The **knee** presents ample bearing surface for table and in addition has extended bearing on column of machine so that with arm, cutter and work are well supported, with freedom from chatter. Our machine has automatic cross, as well as longitudinal feeds.

¶ Get one of these machines and put it to work, and you will know you are making up for lost time.

N.B.—We have just issued a new and very complete milling machine catalogue, and shall be pleased to send you a copy.

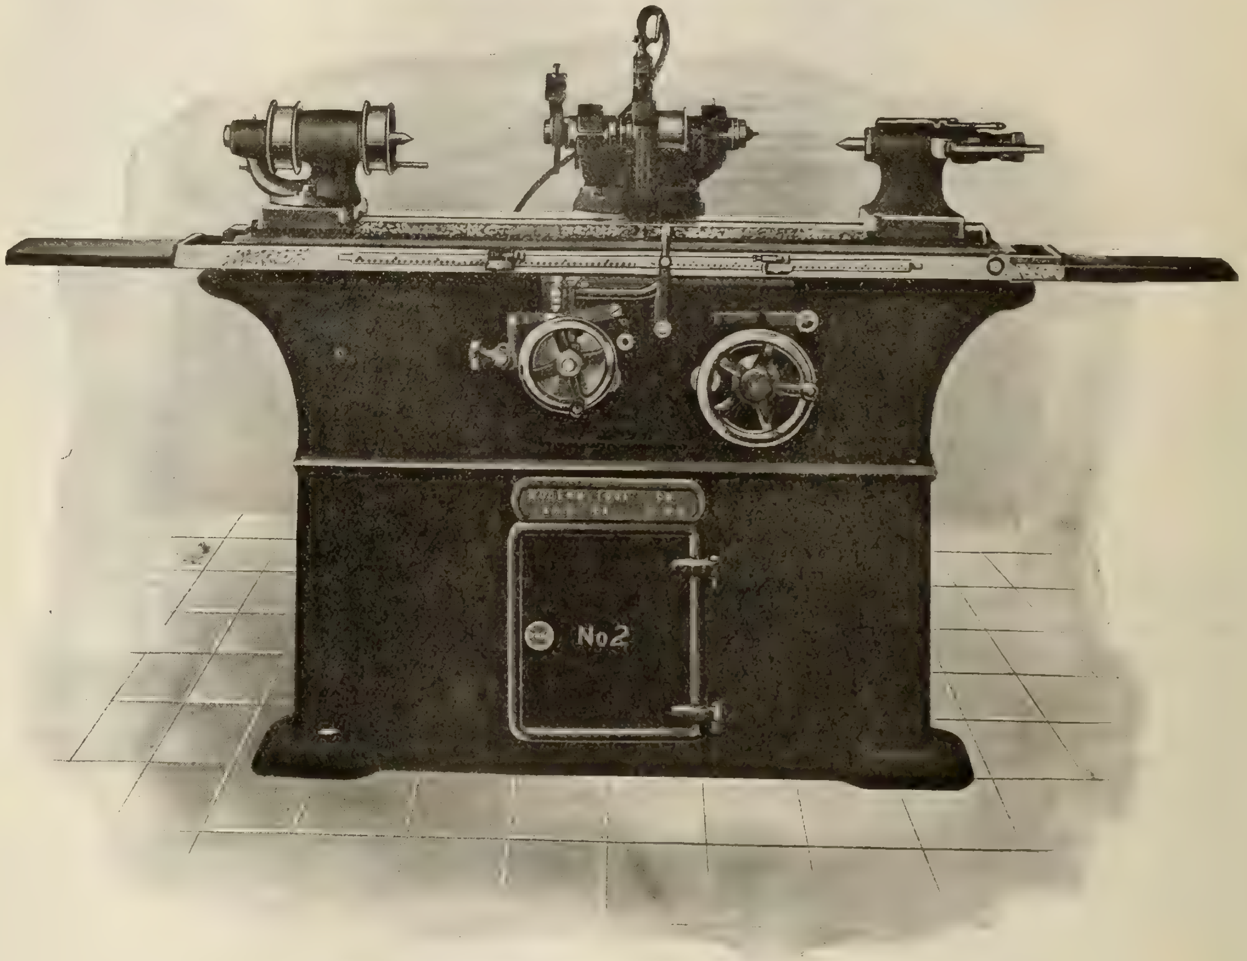
IT IS THE ABILITY TO SAVE MONEY

In First Cost, Operating Cost and Total Cost When the Work is Finished that is Proving to Users of Grinders the Greater Economy of the

“MODERN”



NO. 2 “MODERN” UNIVERSAL GRINDING MACHINE

If you are not using a “Modern” you are wasting half your time. The No. 2 “Modern” Universal Grinding Machine embodies all the refinements in construction necessary in a grinding machine. Convenience and rapidity in operation and facility in making ready for given work enable this machine to be used with economy for all kinds of precision work, in the production of uniform parts in large quantities. It covers the widest range in the Tool Room and factory, and is a machine every manufacturer will appreciate.

Make your machine equipment complete, and further cut your costs with a “Modern.”

Send for the No. 2 Circular.

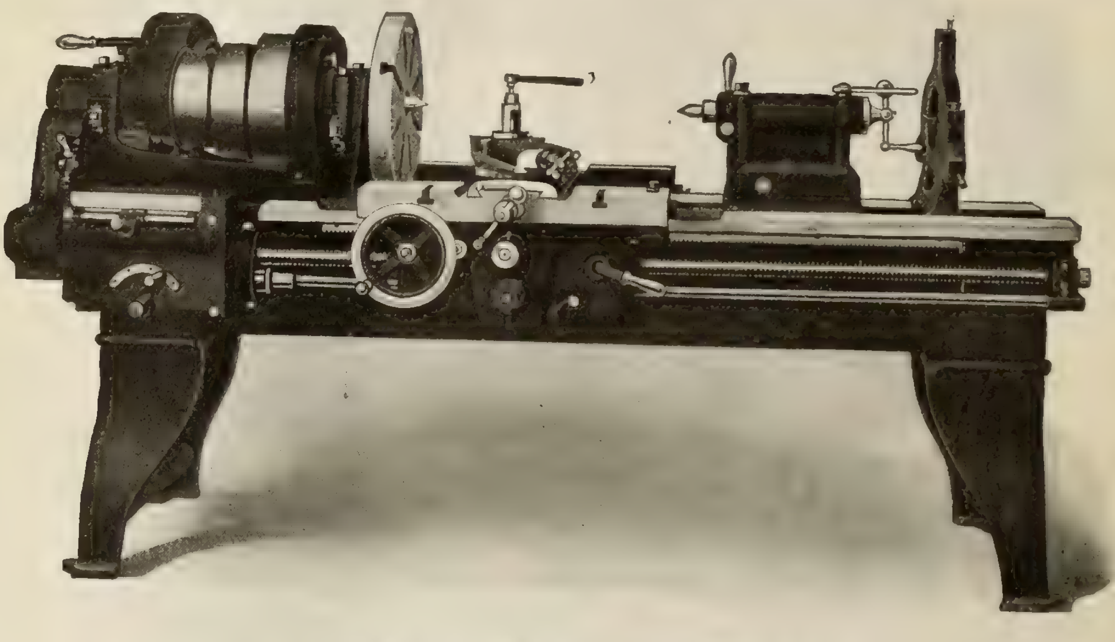
TINSMITHS AND SHEET METAL WORKERS TOOLS, POWER PRESSES, DIES, ETC.

Got 'em All Skinned

Has This New 18" Heavy Duty MUELLER Engine Lathe

We build our lathe to meet the severest requirements of the modern shop, Steel Gearing and Phospher Bronze Bushings throughout. Gears cut from the solid with special cutters, and special formula for phospher bronze for bearings. The highest degree of accuracy can be attained on our lathe.



STOP ONE MINUTE

and note that forty-five (45) different threads can be cut on our lathe, from 2 to 60, including 11½ in. pipe thread. Change obtained instantaneously in the gear box itself, simple as A B C.

Double plate apron, studs, which are of tool steel hardened and ground, supported front and back. Cross V 8¼ in. wide. Compound rest is locked in position by four (4) clamp bolts.

Why, our lathe is made up of good features—not mere talking points—but devices which make for accuracy, durability and convenience of the operator. You simply cannot afford to pass up the proposition we have to offer, so write us **to-day.**

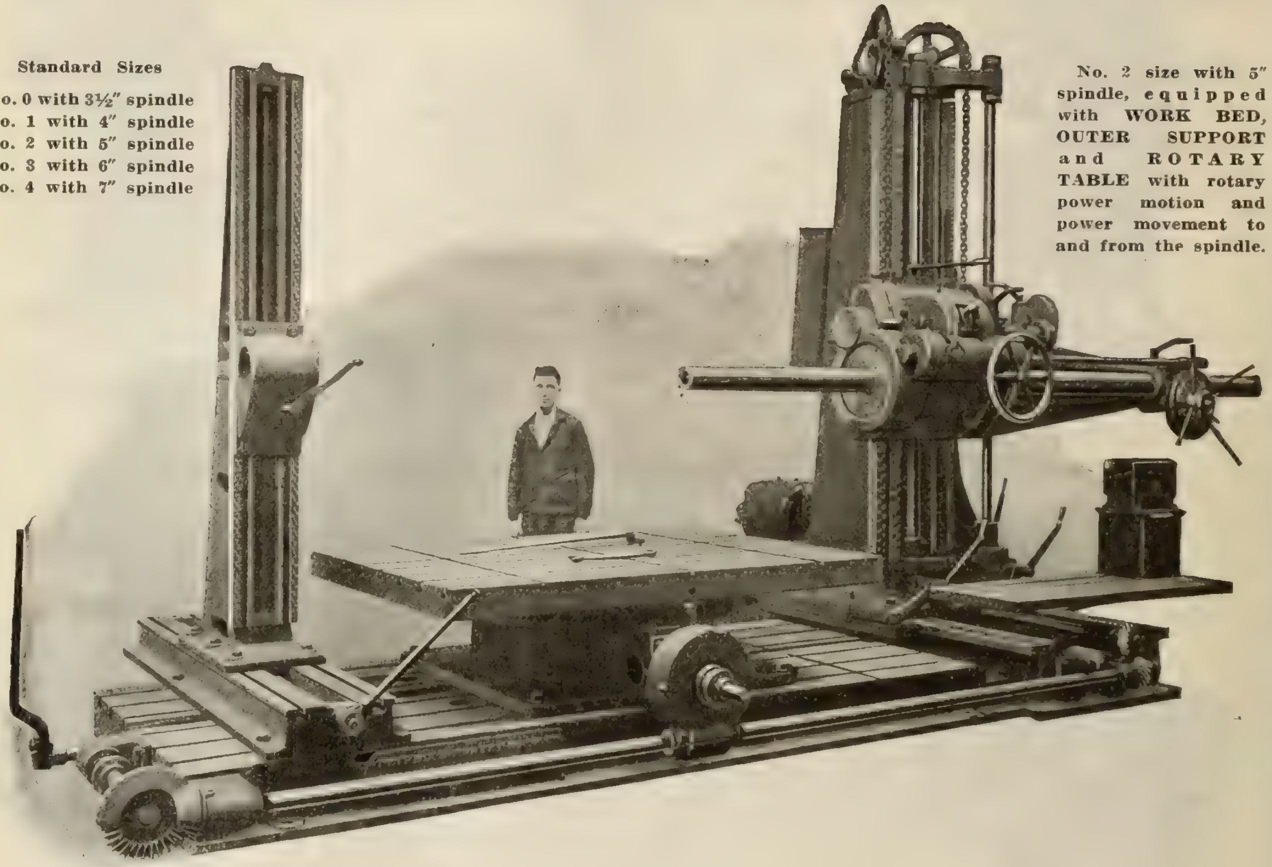
ALL THE WORK AT ONE CHUCKING



Standard Sizes

No. 0 with 3½" spindle
No. 1 with 4" spindle
No. 2 with 5" spindle
No. 3 with 6" spindle
No. 4 with 7" spindle

No. 2 size with 5" spindle, equipped with WORK BED, OUTER SUPPORT and ROTARY TABLE with rotary power motion and power movement to and from the spindle.

It is far easier, quicker and better to finish the different operations at one chucking than to waste the time and effort transferring the work from one machine to another.

By using the rotary table in connection with our machine you can perform *all the operations* on the different sides of the work, no matter how large or irregular in shape, *without rechucking.*

Valuable Features

1. **Centralized Control.** All movements fast and slow by hand and power are **non-conflicting**, any feed and traverse, the starting, stopping or reversing of the machine, or changing from one operation to another can be made at the front of the machine.

2. **The Narrow Guiding Fits** of the Column to runway and of saddle to column, reduce the friction of the machine, the strain on the feed mechanism and retain alignment to moving parts.

3. **Additional Friction Device,** for retaining spindle in its horizontal position against the pressure of cut when milling.

4. **No Belts Used.** All gear driving and feeding mechanism.

5. **All Feeds** are driven by the spindle and are always within a given ratio to spindle speeds.

These Are Our Lines

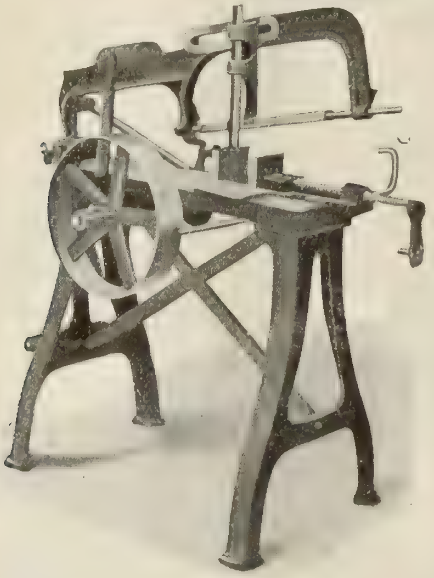
They're Good

The Improved Power Hack Saw

will cover its cost many times over with the money it saves through long, efficient service.

Saws bars 6 x 6-in., either round or square, and is so constructed as to require no attention after work is put in vise, and stops automatically when piece is cut off.

The Improved Saw Guide is a Special Feature—it keeps the saw perfectly in line at all times.

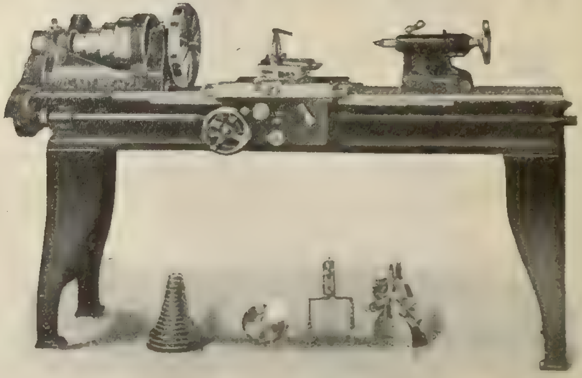


Our Sensitive Bench Drill

is a very valuable machine for rapid drilling up to 5-16-inch in all classes of work. Only the best material and workmanship are used in the construction.

It is entirely relieved of belt strain, and is counterbalanced by a weight inside the frame. It is also provided with means of taking up wear.

If you require any machinery in these lines, we will be pleased to supply you with complete details and references. We expect to put on the market by the first of January a new 16-in. Shaper, and recommend prospective buyers to investigate its merits before purchasing.



The "McKenzie" Engine Lathe

The Standard of Accuracy

Made from new patterns, of improved design, and constructed of the very best material by expert workmen. Every part is mechanicaly perfect and excellently finished.

Its accuracy and durability mean a big saving of money to you.

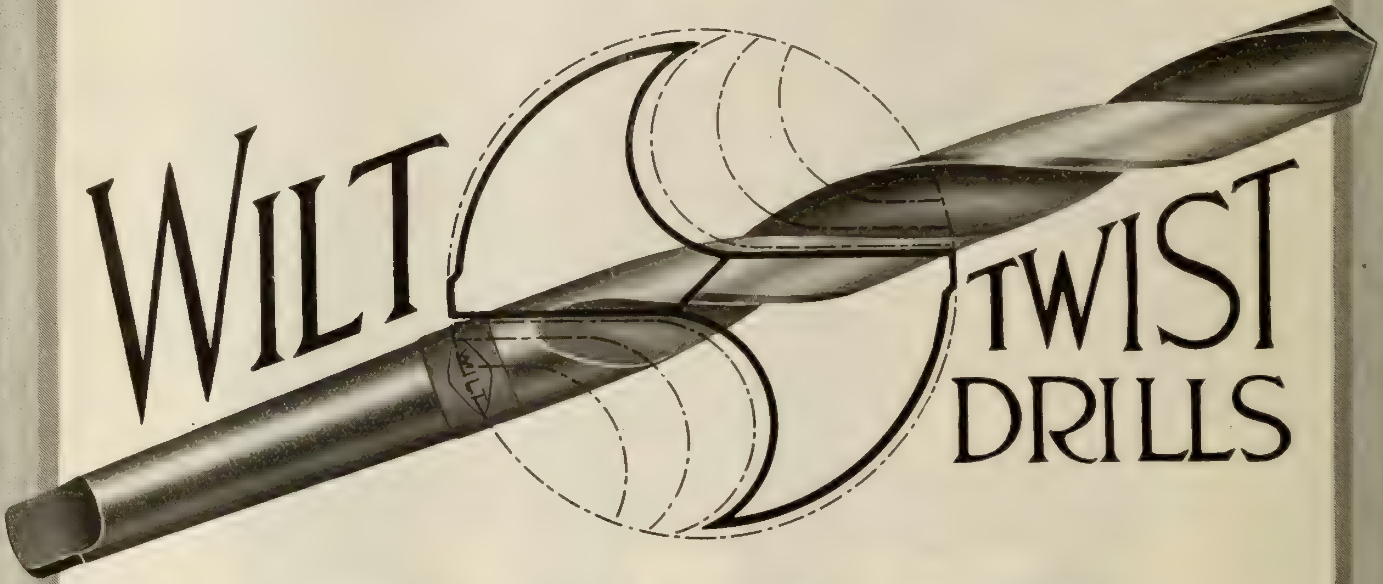
WILT

EFFICIENCY

Your drills should be judged solely by the efficiency they will deliver on the hardest, most exacting service in your shop. If they are efficient on the hardest job—they will be efficient on the easiest jobs.

The efficiency of a drill means its accuracy—its cutting ability and the amount of work it can do WELL without regrinding.



The circle shows a head-on view of a **Wilt Twist Drill**. Dotted lines indicate the 3 roughing cuts and the finishing cut that takes off the last fifteen one-thousands of an inch. Also the relieving cut. All done at a single chucking.

Wilt Twist Drills are made by a new process—a process that is revolutionary in character and that marks the most advanced step that has been taken in drill making in a quarter of a century.

The **Wilt Drill** is made complete at a single chucking—it is accurate to a marvelous degree. The clearance is clean cut and well-defined. The hardening is done with scientific accuracy. The testing and inspecting are thorough to the last degree.

The result is a drill of remarkable character and efficiency.

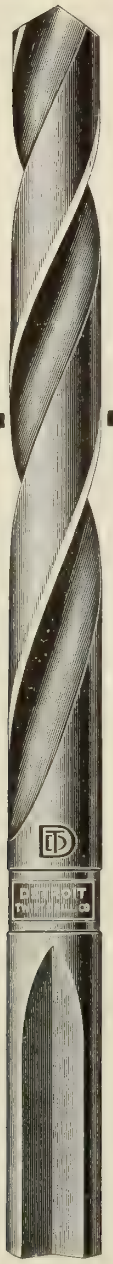
WALKERVILLE, ONTARIO



Willing Drilling Speeds Production

My song I troll out, for Christmas stout,
The hearty, the true and the bold;
A bumper I drain, and with might and main
Give three cheers for this Christmas old!

—*Charles Dickens.*

"Detroit" Twist Drills

and your "costs" are directly related. The time consumed in drilling holes; the kind of holes your drills make; their accuracy, etc.; the average life of the drills used; the time required for re-grinding; all these are factors in production costs.

"Detroit" Drills are specified by many of the largest users of machine tools—automobile builders, railroads and manufacturers in widely diversified lines, because it has been proved by actual use, year in and year out, that they give the best and most economical service.

Isn't it about time to determine what drills, reamers, cutters and other small tools you will use during 1914?

May we demonstrate *in your own plant* that you can not possibly buy better drills at any price, than those which bear our trade-mark. When?

Write us today and ask for Catalog "R"

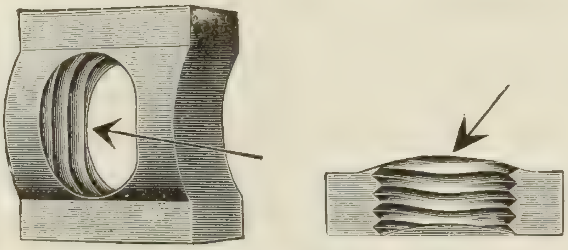
The Galt Machine Screw Company, Limited
GALT, ONTARIO

This is a Statement and a Fact

Guaranteed 100% Pure



Can be re-applied without injury to the threads of the bolt or nut.

Not a spring or jam nut.

This cut shows an exaggerated curve in thread pitch—or more than is given in practice, in order to emphasize this feature.

Let us show you that the Grip Nut is cheapest in **First Cost** of application.

That it will prevent loss of nuts, and accidents resulting from the same, causes that send the car to the repair shop, when for the want of a nut the service of the car is lost.

Standardization is economy and if **Grip Nuts** are cheaper (and they are), you effect the greatest saving by adopting them as common standard for all uses where lock nuts are required.

We offer our records of a growing demand for Grip Nuts as proof of our statements, and the services of practical, experienced railroad men to demonstrate the merits of our device.

FIRTH'S TOOL STEELS

are recognized as STANDARD brands in every country where steel is used, and Quality considered, they are the cheapest.

Since the foundation of the firm in 1840, Thos. Firth & Sons have maintained a peculiarly high Standard of Quality for their products, and their Tool Steels are the **best** that can be manufactured, **not the cheapest that will sell.**

We have the largest stock of High Grade Tool Steel in Canada, and the following brands are on hand in our Montreal warehouse:—

FIRTH'S **EXTRA** TOOL STEEL

FIRTH'S **BEST** TOOL STEEL

leading brands of **Carbon** Tool Steel, in all principal sizes. **Annealed** and **Unannealed.**

For Punches, Taps, Reamers, Cutters, Dies, Shearblades, etc., Firth's Extra has no superior in Carbon Tool Steel.

FIRTH'S **EXTRA SNAP** STEEL

made expressly to resist the wear caused by rapid vibration and to minimize breakages in the shank of the Tool. A great money saver.

FIRTH'S **SPEEDICUT** HIGH-SPEED STEEL

(Our latest improved)

unequalled for rapid cutting, and for all round general efficiency the best High Speed Steel produced.

SPEEDICUT TOOLHOLDER BITS

Cut with angle ends. **Hardened,** and only require to be ground and put to work. 1-4, 5-16, 3-8, 7-16, 1-2, 5-8 and 3-4 Square in stock.

We also manufacture Steel for Mining purposes, Nickel and Nickel-Chrome Steel, Steel Forgings, Marine Shafts, Tyres, Gun Forgings, Projectiles, &c., &c.

TURNING HARD METALS

CUTTING ALL METALS HIGH SPEED

ANNOUNCEMENT

WE are now in position to fill orders for the celebrated brands of "A. W.," "T. Y. R.," and "A. W. Premier" High Speed Tool Steels and Twist Drills, from stock in Montreal.

"A. W." brand is recommended for general workshop use —for the manufacture of Twist Drills, Milling Cutters, etc.

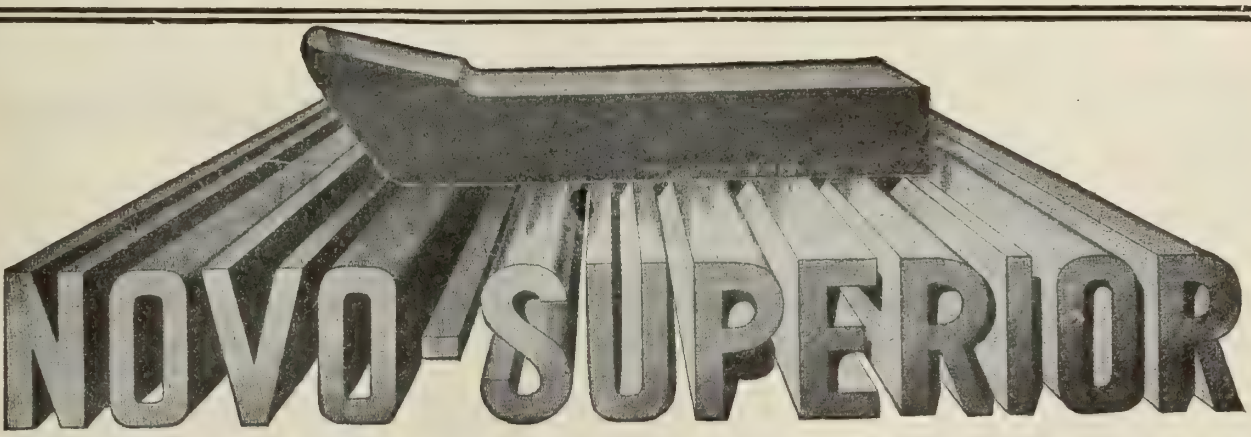
"T. Y. R." brand is solely for cutting, at high speeds, metals such as Railway and Tramway Tyres, Chilled Rolls, etc.

"A. W. Premier" is a special quality for exceptionally severe cutting at high speeds, for the manufacture of formed tools and other especially exacting work.

OUR PRODUCT IS THE RESULT OF YEARS OF

TURNING MILLING DRILLING

EXPERIENCE



High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

The Northern Light is the latest development in MAZDA Drawn Wire electric lamps. The range includes—15 Watt (12 candle power)—25 Watt (20 c.p.)—40 Watt (32 c.p.)—60 Watt (48 c.p.)—and up to 500 Watts.

Northern Light Madza Lamps give about three times the light of the old-fashioned carbon lamps and consume no more current. A 16 c.p. carbon lamp consumes 56 watts and gives only 16 candle power light. A 25 watt Northern Light Mazda Lamp consumes 25 watts and gives 20 candle power light.

Look for the name *Northern Light* etched on each lamp

You will save 55% in cash and get 25% more light.

For your convenience Northern Lights are packed in corrugated paper and put up in boxes.

The boxes provide safe storage for your emergency supply. You can buy Northern Lights from your electrical dealer or at our nearest house.

Office and Works at Brantford Ont.
Head Office Transportation Building, Montreal Que.

Brantford Ont.
July 22nd, 1913.

The Canadian Automatic Transportation Co. Ltd.,
Welland - Ontario.

Gentlemen

Your favor of the 15th inst. is received. The Tractor we purchased from you has been in constant use for several months. We use it for hauling castings from our Annealing department to the Shipping room. The load is generally about two tons. The machine runs over a very rough road without any apparent effort. We use two men, one to operate and the other to assist in unloading. We formerly used seven men to do the same work, of about seventy tons per day. This is one of the best labor saving machines we have on the plant, and we cannot speak too highly of it.

Yours very truly,
C. G. Burgess
General Superintendent.
Malleable Foundries.

CGB/RGA.

USERS SAY

"Big Time and Labor Savers"

How can **you** afford to maintain the old method of hand trucking when our **Electric Trucks** are procurable?

They are very powerful, and when loaded will negotiate grades of from 15 to 25 per cent. with ease, and will cover a distance in one-quarter the time. **Handle about six times as much material as hand operated trucks,** and do the work quickly and efficiently.

Our trucks are easily controlled and can be readily turned into small space—no skilled operator is required.

Let us give you complete details and specifications.

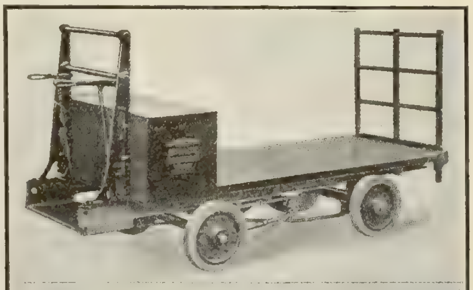
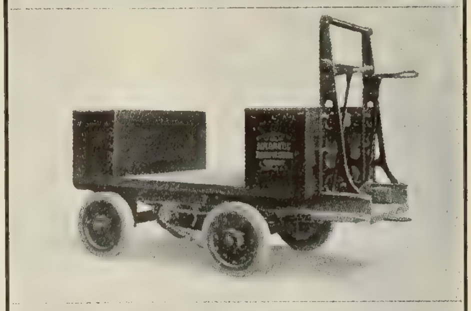
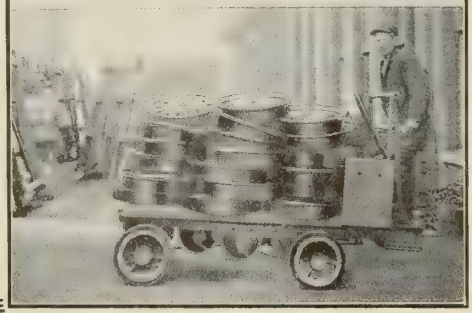
Canadian Pacific R.R., Pratt & Letchworth Co., American Cyanide Co., Wm. Davies Co., Northern Aluminum Co., Dominion Express Co. (on order).







HIGH QUALITY BELTING

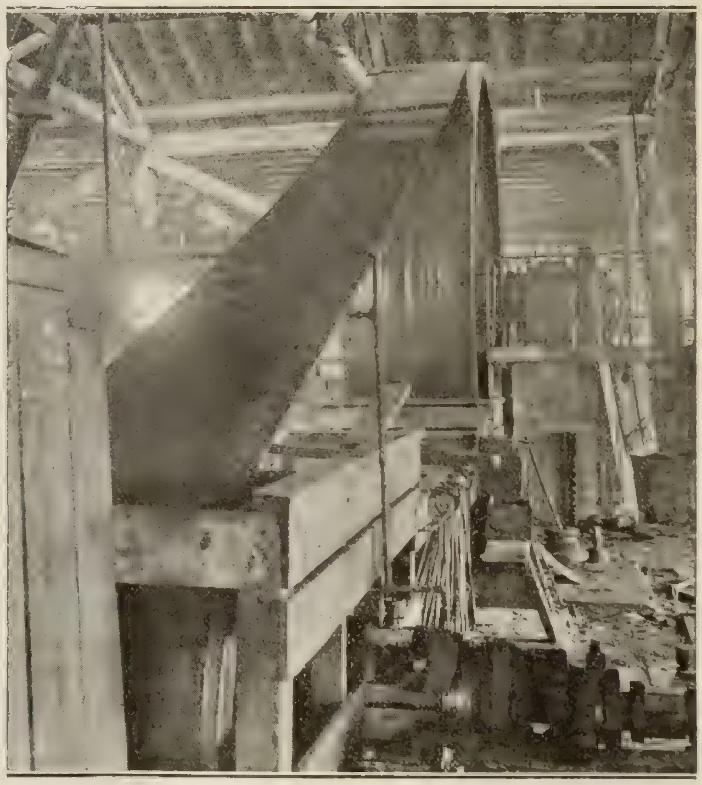
Main Drives a Specialty

Few reasons why **Leviathan Belting** is the kind to use

It has more pull and less slip.
It is not affected by atmospheric changes and conditions.
Can be run slacker than leather, thus putting less strain on bearings.
Has no joints to separate or peel, and its traction power exceeds that of best leather.

This 38 inch x 10 ply LEVIATHAN BELT

replaced a triple leather belt in one of the largest steel plants in Canada at **40% less cost** than the best leather. It has also **increased the production** of the mill by eight to ten tons per day.



Let us send you ONE ON TRIAL

so as to prove that they are as exactly as we claim.

When ordering, give diameter of driving pulley, and approximate horsepower to be transmitted.

We have sold Leviathan Belting on the "make good" basis for over 30 years. We would not be in business to-day if it didn't make good.

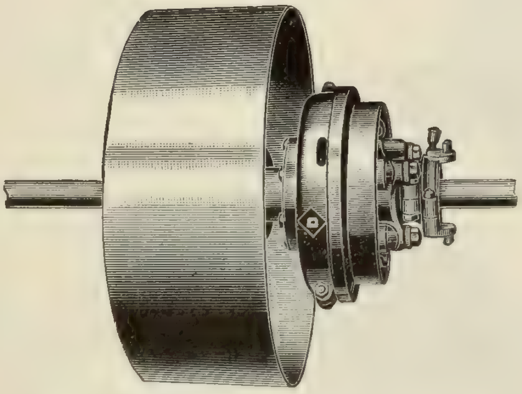
☞ TO ENSURE SATISFACTION—STATE WHERE BELT IS TO RUN ☜

Get Your Men and Machinery on the Safe Side



THE Safety of your employees is an important matter, one which the law demands shall have your attention.

¶ The Dodge Friction Clutch provides the maximum of safety to your men in that it enables the power to be cut off in the nick of time. There are laws in force in some countries demanding the use of friction clutches for just this reason.

¶ The Safety of your machines from idleness, means increased production.

¶ Dodge Friction Clutches on the line-shaft do away with the necessity of shutting down several departments when some little thing goes wrong, or you want to make an installation or alteration. They also eliminate waste power in idle departments, or, in other words,

¶ The Dodge Friction Clutch puts your men and machines on the safe side at small expense. It is split, that means can be put up and taken down without disturbing other equipment, can be used as a cut-off coupling, for driving pulley or rope sheave, or for attachment to quill carrying a main driving wheel.

¶ Our Engineering Department will gladly give you correct advice on subdividing your power transmission machinery into separate safe and efficient units.

Mail us the attached coupon or postal card for our booklet "Friction Clutch Mechanisms"

D

**Ball and Socket
Adjustable Hanger**

D

**Ball and Socket
Adjustable Hanger**

The Most Economical Roadbed For Power

THAT steady, stealthy *loss* that besets so many factories—*excess bearing friction*—can be eliminated easily and at a very moderate cost by the use of ball and socket, self-lubricating hangers and bearings correctly designed and carefully made. It is a surer way than resorting to ball or roller bearings or individual motors and is far less expensive in both first cost and upkeep.

Dodge bearings reduce friction because there is a true ball and socket connection between the bearing and the frame in hangers and pillow blocks, which permits the bearing to freely align with the shaft. That means equal pressure and reduced friction.

Alignment of shafting is a very important factor in eliminating excess friction and perfect alignment can only be obtained by adjustments which preserve the necessary ball and socket connection. This is accomplished in Dodge hangers by means of a *four-way adjustment.* Vertically by large diameter threaded cast iron plunger screws, machined on the ends to fit the ball on the bearings, and horizontally through slotted holes in the base of the frame. This is the only proper method of four-way adjustment.

In a true ball and socket hanger, with self-lubricating bearings having a perfect and continuous circulation of lubricant, the shaft runs on a film of oil and does not touch the metal lining of the bearing. That is the kind of hanger the Dodge is. For day in and day out, year after year service it is the most nearly "anti-friction," and the most economical shafting bearing on the market to-day.

Dodge hangers and pillow blocks are furnished with ring or capillary self-oiling bearings, all lined with a high-grade metal, and *bored* and *reamed.* One filling of oil will last three to six months. They are carried in stock at Dodge branches and by leading machinery and supply dealers in all parts of the country. When buying hangers, pillow blocks, or any shafting bearings, specify Dodge. They will make the best roadbed for *your* power.

Send for latest catalogue.

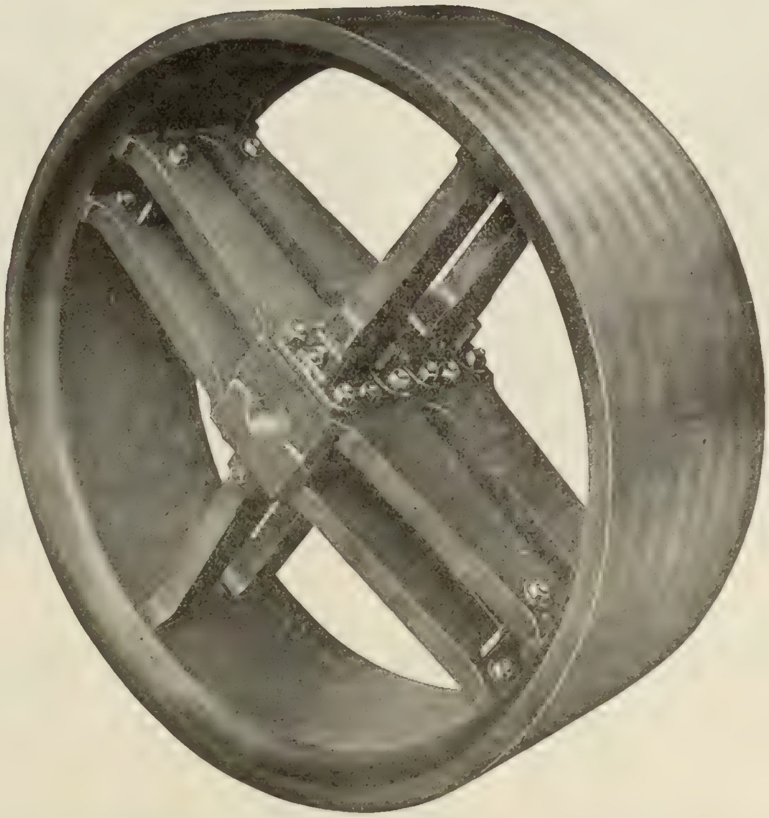
Dodge

Wood Split Pulleys

"1886"
"1913"



27 Years
in Service

WHEN you buy wood split pulleys, you should be sure to get good pulleys; pulleys that will prove to be an investment, not an expense.

Dodge "Standard" are good wood split pulleys. Just as good as selected, seasoned, kiln-dried stock, combined with skilled workmanship and twenty-seven years of "knowing how" can make them.

The proof of any pulley is in the running. Dodge wood split pulleys are balanced, and run true. They are backed by the Dodge guaranty. There are over one million "Standard" wood split pulleys in successful operation and the output each year is greater than the year before.

There are reasons for this. First, the quality and merit of the pulley. The facility with which it can be mounted on the shaft. The interchangeable bushings, by means of which it fits all sizes of shafting within a wide range. The perfect shaft fastening without keys or setscrews. The superior belt surface. And, last, the moderate price as compared with pulleys of any other type. Dodge wood split pulleys will run satisfactorily anywhere that regular leather belting can be used.

Something
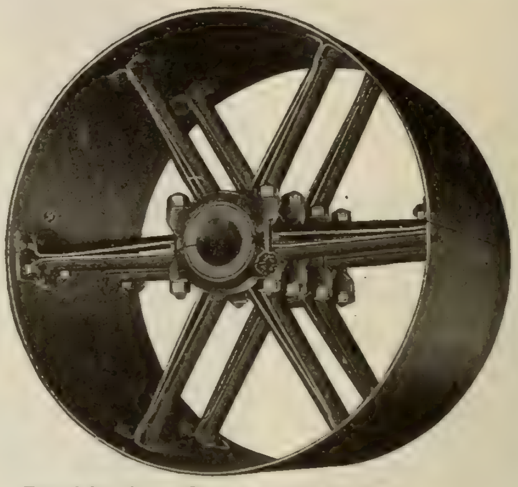
Better



Double Arm Steel Split Pulley

Admittedly the Most Perfect Steel Split Pulley on the Market!

Rims ¼" steel—cannot dent, bend or break!

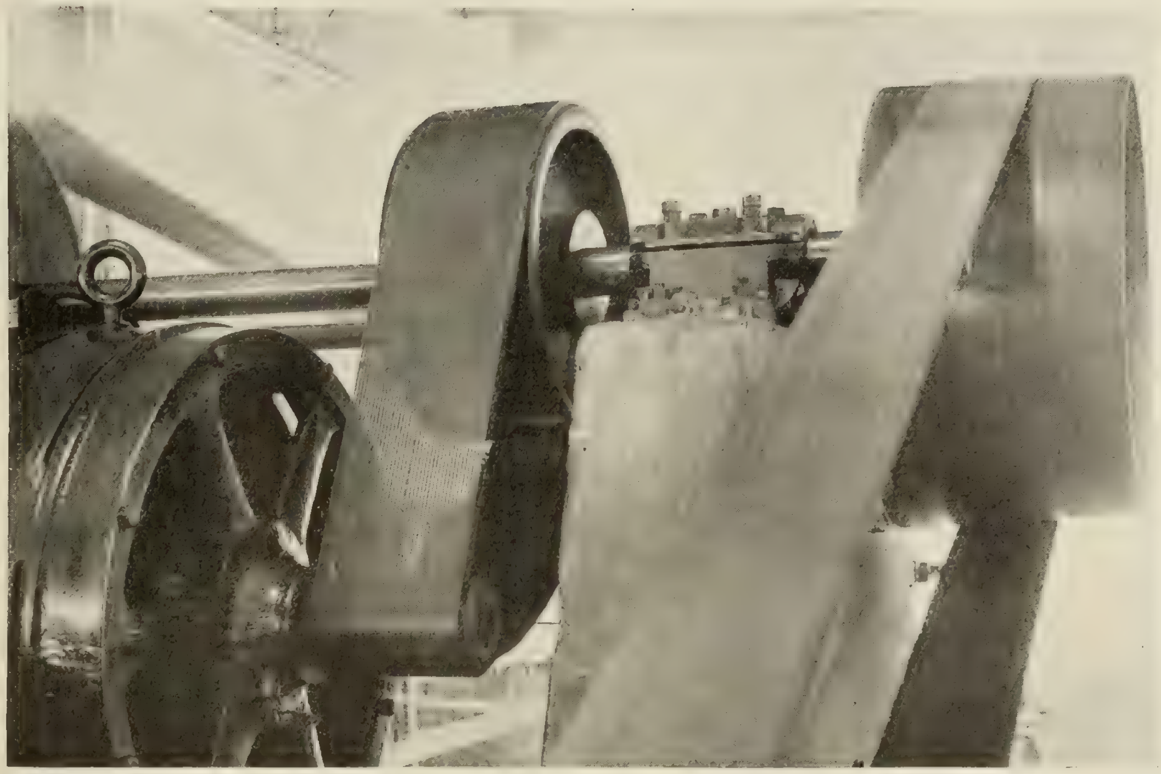
No grooves through centre to decrease belt adhesion. This seamless and beadless rim is strong and true running.

Arms support rim on either side of parting.

We carry complete stocks at Toronto and Montreal. Order a sample pulley for comparison of quality and price.

DODGE MANUFACTURING CO., Limited
TORONTO MONTREAL

You can see through this Link-Belt Silent Chain Drive



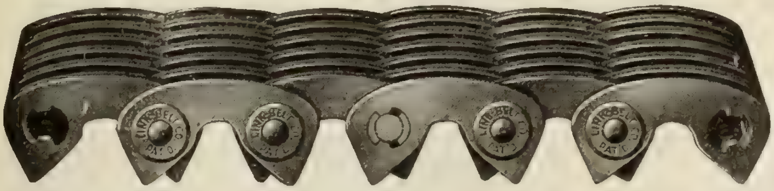
50 H.P. Link-Belt Silent Chain Drive running 1,200 feet per minute. This is an actual photograph.

Why can you see through the Drive?
Because it runs smoothly.

Why does it run smoothly?
Because the binding action in the JOINT is perfect.

What does that mean to the user of Link-Belt Silent Chain Drives?

High efficiency of the drive — long life, few repairs, satisfaction.



The success of the Link-Belt Silent Chain is due wholly to the superiority of its joint construction. The segmental bushings, which are removable, extend across the entire width of the chain, thus doubling the bearing surface and halving the bearing pressure on the joint. The bushings are case-hardened and bear upon the case-hardened pin. The latter is free to, and does, rotate with reference to the bushings and presents every particle of its surface for wear. As a result it wears uniformly, keeps round and maintains to the end its high initial efficiency.

We are the originators of the Liner Type (or Bushed Type) Silent Chain

The PHILIPS Pressed Steel PULLEY

For Long Life and Hard Service

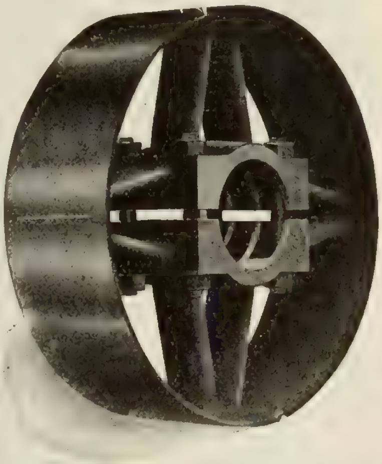
VENI UT VINCEREM
TRADE MARK

The Philips Pressed Steel Pulley is a combination of great strength and grace. It runs absolutely true and can be quickly placed on shaft without disturbing same.

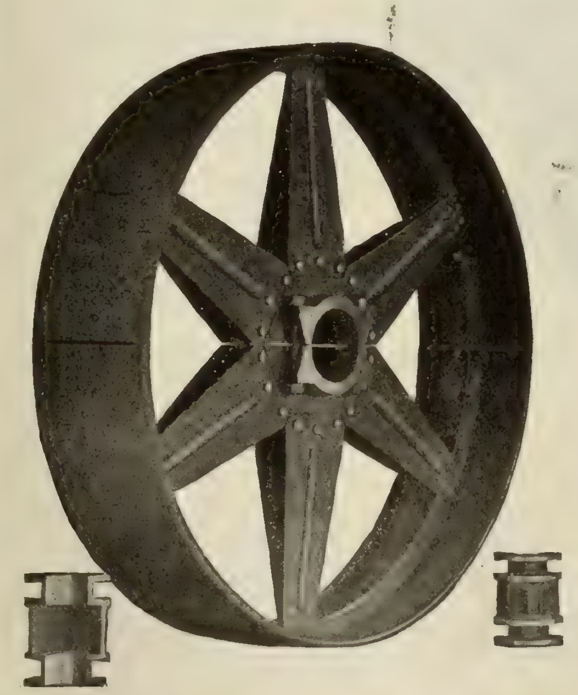
The Face presents an even, unbroken perfect crown, furnishing entire belt contact, and permits no power to be lost between belt and pulley.

Philip's Cast Steel Pulleys weigh one-half as much as similar sizes in cast iron, and consequently decrease the friction load and weight on the shafting to that extent.

Philip's Cast Iron Bushings are lathe turned and bored, insuring perfect fit, and their use permits the placing of a pulley on different diameter shafts by simply an exchange of bushings.



Cast Iron Split Pressed Steel Pulleys
6 to 11-in. diameter, 8 to 12-in. face inclusive.



Steel Split Pulley from 12 to 48-inch Diameter;
3 to 12-in. face.
We carry a full stock of all sizes.

Philip's Pulleys are guaranteed equal under all conditions to double belt cast iron pulleys. There are thousands of them in use—and all are showing highly satisfactory service.

We will be pleased to furnish you with the fullest particulars—and you will benefit by getting them.

Why not write us to-day?

Federal Engineering & Supplies
Limited
Toronto **Montreal**

In an Age of Steel—
Steel is the Best Pulley Material

WHEREVER strength combined with lightness is desired, whether in the skeletons of sky scrapers or in watch springs, steel is used. These same qualities make steel the logical pulley material.

"American" Steel Split Pulleys

are probably more numerously used than any other make of metal pulley, and more than all other steel pulleys combined.

Of the more than 2,000,000 "American" Pulleys shipped from our factory, less than two-tenths of one per cent. have been reported as failing in service.

"American" Pulleys are light, strong and practically indestructible. They may be bushed down so as to take an immovable grip on various sizes of shafts.

READ THIS REPORT

From a Superintendent and Engineer to their Managing Director

THE VICTORIAVILLE FURNITURE CO.
Manufacturers of Medium Furniture

Mr. J. E. Alain, Managing-Director,
The Victoriaville Furniture Company.

Victoriaville, P.Q., Nov. 20, 1913.

Dear Sir:—

Since we have been operating with the Chapman Double Ball Bearings Shafting equipment, we have made a careful study of our cost and efficiency system, comparing the output with our old system versus the Ball Bearing; and have much pleasure in submitting the following report, which should be interesting to any factory using power. You will also note that the equipment of ball bearings installed on our line shafting so eased the load on our power plant through the elimination of friction, that the machines were able to run at their proper speed with the following interesting results. These results are **entirely outside** of the saving in power which in **addition** to the increased production, as shown below, will amount to over **20 per cent. of the entire power:**—

Linderman Machine:—

The record of this machine on old system of transmission had an output of 2,600 ft. daily, when we are getting with Ball Bearing system an output of 2,800 ft. on the same machine, thus giving us a daily gain of 200 ft., based on direct wages of $5.65 per day, or 2,400 ft. for twelve working days, or a net gain of $5.22 for 12 working days or fortnight.

Planers, 3 machines and one Buzz Planer:—

Lumber ready to go through Sandpapering Machine:—

Old system took 404 hours to finish 49,000 ft., direct wages $31.20. Ball Bearings took 390½ hours to finish 54,000 ft., direct wages $31.20. The above will show that we produced 1,210 ft. per day on old system, comparing with 1,380 ft. a day with Ball Bearings. 1,380 ft. multiplied by 12 working days will give a total of 16,560 ft., being the production of twelve days with direct wages of $31.20 or a gain of 26 cents per thousand feet, based on 16,560 ft. will give us a net gain of $4.30 per fortnight.

H. B. Smith's Triple Sander Machine:—

Direct wages on old rate for an output of 21,715 ft. were $18.10, while the direct wages with Ball Bearings on an output of 35,400 ft. were $29.07, thus making a gain of 9 cents per thousand feet, based on 35,400 ft. being a fortnight's output made clear gain of $3.18 for twelve working days.

(Signed) Frank McDonald, Superintendent.
" Jos. Beaudet, Engineer.

N.B.I.—The above has been referred to our Cost Accountant, and I have much pleasure to confirm the same.

(Signed) J. E. Alain, Managing-Director,
The Victoriaville Furniture Company.

Over 2,000 Canadian Factories are getting similar results. Can you afford to operate without Chapman Double Ball Bearings?

No trouble to change over—Our Bearings suit any standard Hanger.

Our Double Ball Bearing LOOSE PULLEYS will operate perfectly WITHOUT LUBRICATION OR ATTENTION EXCEPT A LITTLE VASALINE ONCE A YEAR. Your loose pulley trouble will be a thing of the past.

Write us for particulars and let us figure with you on an equipment of Chapman Ball Bearings for your plant.

The Chapman Double Ball Bearing Co. of Canada

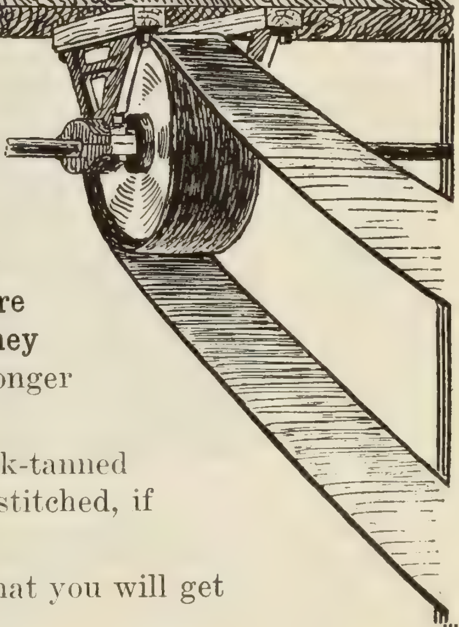
ALEXANDRIA, ONT.

J.D.McArthur's Leather Belting



The great trouble with belting—no matter how good the leather—that is joined up with the ordinary splice, is the fact that the splices come open, causing loss and delay.

J. D. McArthur's Saffron Tanned Belting is especially valuable on fast running machinery. **The splices are stitched with a waxed thread lock-stitch machine**—**they cannot come open**—they cause the belt to wear much longer than it ordinarily would.

Our Oak Tanned Belting is made from Prime English Oak-tanned Leather. Splices of single or double belting can be stitched, if required, with the machine as mentioned above.

The Splice and the high quality of our belting mean that you will get maximum results.

Bear us in mind when on the market for belting. We can lower your transmission cost.

J. D. McArthur & Company, Brockville, Ont.

The Fabric Belt Lace Works

45 KING ST. EAST, BROCKVILLE, ONT.

¶ A much needed want supplied. A strong durable Belt Lace, stronger and cheaper than leather. Made in ¼ inch, ⅜ inch, ½ inch widths. Put up in 50 feet boxes.

¶ This Lace has been thoroughly tested and has proven in every way satisfactory. Hardware dealers keep it in stock.

Is Scarce Just Now, But

We can show you a great saving in your transmission costs, and at the same time a greater efficiency, by the use of

Asbestos Lubricants That Kill Heat

When you think of the prevention, or reduction of heat, you instinctively think of ASBESTOS.

As a result of the latest strides forward in the manufacture of lubricants, we are able to give to the manufacturing world

ASBESTOLENE

A lubricant that is manufactured specially to meet the growing demand for a high-grade friction eliminating substance, one that prevents heat due to friction, and reduces that friction itself to the minimum.

SPEDOLENE

Designed especially for use in connection with Transmissions, Differentials, Universal Joints, Bearings, and all worn gears in Motor Cars or Trucks. Where rapidly moving parts are to be satisfactorily lubricated, this cannot be equalled.

AXOLENE

Is the most economical grease. Where there is a demand for a heavier bodied lubricant, this meets the requirements perfectly. It does not become hardened with age, it is not affected by atmospheric changes. It meets with general favor as a lubricant where slower speeds are to be encountered.

ASBESTOS LUBRICATION

is shown to be, by the growth of its general favor, the coming means of effectively doing away with the costly and bothersome bearing troubles.

Our various products are manufactured under our guarantee, are carefully sealed when leaving our factory and are in perfect condition when delivered to you. Let us tell you how to

Increase Your Dividends By Decreasing Your Expenses.

MAGNOLIA
ANTIFRICTION
METAL

Of Human Interest

There is often more to our advertisements than the mere dry, technical side. There is food for the imagination in such letters as the one we recently published from an Engineer in far-off fever-stricken Africa, where, like as not, he met, as he was going in, the coffin of his predecessor as it was coming out; or the letter from the Engineer describing his anxiety as he watched the crank pin of a racing engine in a gale off a lea shore in the Bay of Biscay. Below we give an interesting letter from Arica, Chili. These letters, coming from the remotest parts of the earth as well as many nearby, all gratefully acknowledge that Magnolia Metal stands up to the scratch where other babbitts go down, and its value is sometimes almost beyond computation.

FERROCARRIL LONGITUDINAL DE CHILE SECCION NORTE.
Contratistas, Macdonald, Gibbs & MacDougall (Chile). Arica, 5 Apr., 1913.

Gentlemen:—I have great pleasure in stating to you the result of my experience in different classes of metal that I have tested on our engines here; which, considering the difficult work that I have to do, is pleasing. The great trouble on our rack loco engines was that the wear on the working parts was so much that they were continually in the shop; now, you can understand that on construction work to have your engines lying in the shop it was up to the shop, and the Manager saw it too. I tried babbitt true metal, solid brasses, other classes of metal, but not until I met your Magnolia did I get the relief that was my aim. On this road where the rain has not fallen for more than human agency can remember, the dust is so great that it almost beats the Sahara; and for your metal to show the road to other makers as regards economy in cost in wearing ability, therefore most reliable, is, I think, a splendid recommendation to other engineers who may be in need of a good metal, to whom reliability is everything.

Yours faithfully, (Signed) H. S. THOMAS, Engr.

J-M

ASBESTO-SPONGE FELTED PIPE Covering

The Ideal Insulator for High Pressure Pipes

Made up in laminated form like the leaves of a book, J-M Asbesto-Sponge Felted Pipe Covering confines a large number of small particles of dead air between the layers. Thus maximum insulating efficiency is secured. The layers consist of thin felts composed of pure Asbestos fibres and finely ground sponge, forming a real cellular fabric. J-M Asbesto-Sponge Felted Pipe Covering is tough, yet flexible, and is practically everlasting. It can be removed and replaced as often as required, without injuring its efficiency. For high pressure and superheated steam pipes it has been proved by years of severe testing to be without an equal as an insulator.

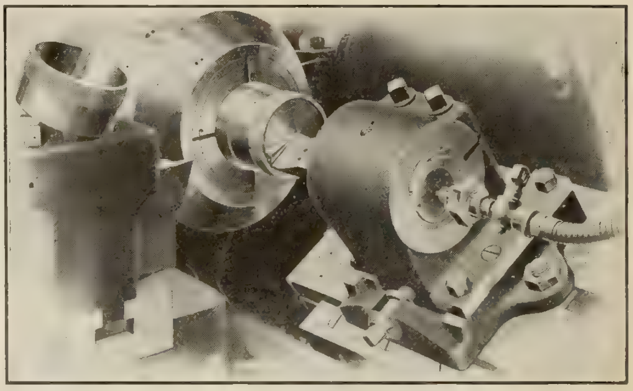
"LAFFITTE" has had many imitators, but never a competitor.

Here's a "Gridley" Set up—



Set-over Tool Holder and Tool at Work.

Take a careful look at this illustration. See how rigidly the cutter is held, how the Gridley Turret supports the tool right under its cutting point.

Look at the wide forming chip made by the cutter; imagine trying to do work accurately this way on one of the old style, chattering, insecure, high turret machines.

This is just one of the advantages of Gridley Construction. There are many others, some of which we have collected together and put in a book called "Gridley Automatics."

By sending for it promptly you'll be taking a step towards greater efficiency in your Turret Lathe department.

So drop us a line to-day.

We manufacture Gridley Automatics, both single and multiple Spindle.

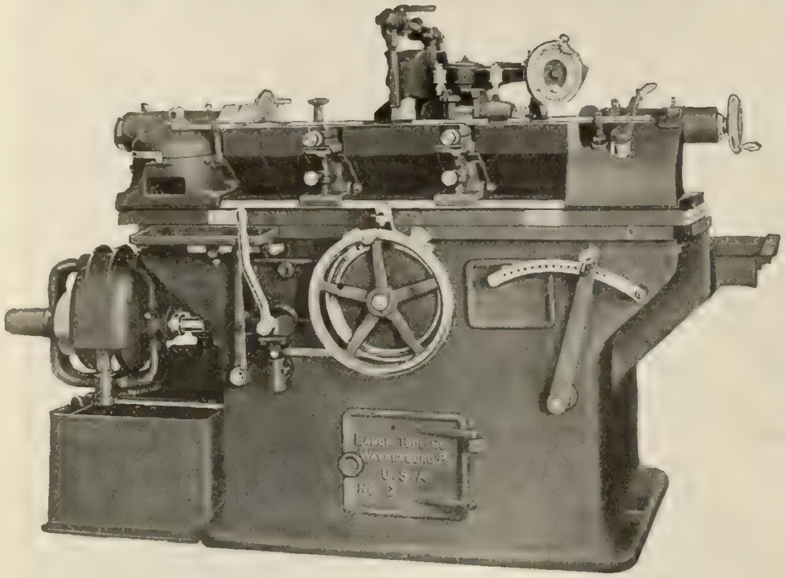
LANDIS Universal Grinding Machines



Combining as they do both an external and internal grinder, their field of usefulness is practically unlimited. They are especially adapted to tool room service, for finishing such work as straight and taper spindles, arbors, rolls, male and female gauges, dies, reamers, plain, angular and forming milling cutters and a large variety of other work which can be held by either a face plate or chuck.

The range of their efficiency is increased by the use of such attachments as magnetic chuck, side mill grinding attachment, cam grinding attachments and special attachments which are easily and quickly applied.

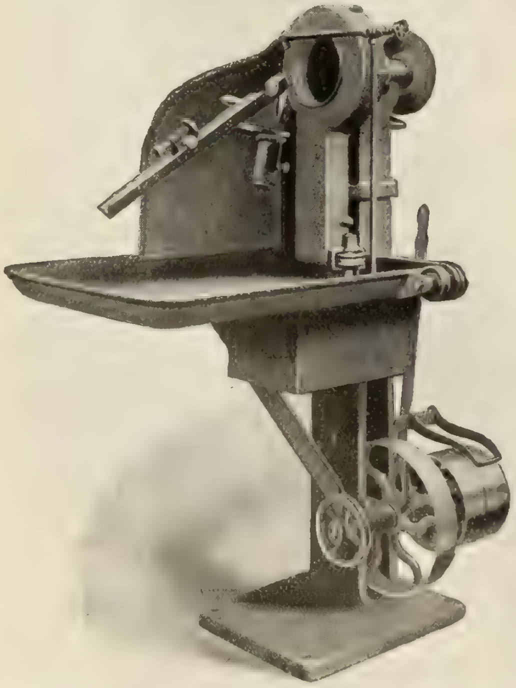
There is Practical Economy



In a Properly Ground Drill

It does more work, better work, and does it longer without re-grinding.

THE AMERICAN DRILL GRINDER

assures the proper shape on every drill ground by it. Each lip is of equal length, clearance is correct, and the grinding is done quickly, easily and accurately, even by unskilled workmen.

There is more economy in a properly ground drill because it does more work, better work, and wears longer without re-grinding. Even the poorest operator can obtain satisfactory results.

Our free booklet on Drill Grinding Machines contains much valuable data on grinding drills. A postal card will bring it. Write to-day.

RE RENOLD SILENT CHAIN DRIVE.

Gentlemen:—In reply to your enquiry of Jan. 30th, I may say that the Renold Silent Chain Drives we have installed are giving every satisfaction.

Our first drive was installed to replace a 12-in. belt which was giving us trouble on account of short centres; this chain has run continuously for four years without the slightest trouble.

Our second drive was installed on a mixing machine doing heavy duty and which has previously broken up two sets of spur gearing, this chain has run over three years with no sign of wear yet.

Our third drive was installed on a calendaring machine after breaking two sets of helical gears, and this has been so successful that we are now installing two more similar drives.

I would be perfectly willing to make an appointment with any person genuinely interested and show him the drive in operation.

Yours truly,——————,*

*Name on application.

The above comes from one of the largest manufacturers in Montreal and is signed by the Mechanical Superintendent. Up to the present (1913) these drives have not received repairs of any kind.

This same company have since made large extensions and we have executed for them many repeat orders.

"Buffalo" Steel Plate Fans

BUILT TO ORDER

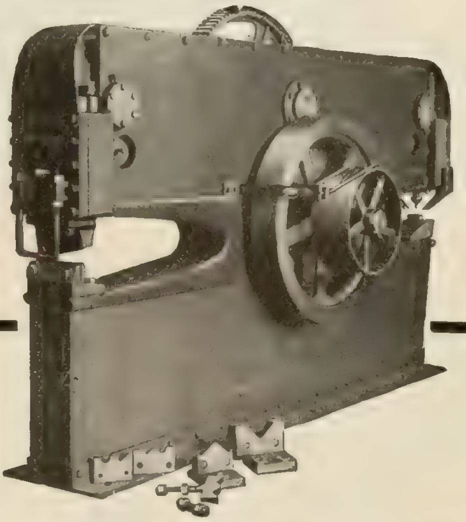
Built to suit individual requirements, for any pressure up to 24 oz. Distinguished by slow speed, enabling us to furnish positive guarantees as to efficiency that cannot be surpassed. Equally well adapted for motor, engine and pulley drive.

"Everything in Fans, Blowers and Exhausters." Dept. "N."

Canadian Buffalo Forge Co , Limited

MONTREAL, QUE.

WINNIPEG TORONTO VANCOUVER



Buffalo "Armor Plate" Punches and Shears

Where light weight and saving of space are objects of importance, the Buffalo Armor Plate construction is of great advantage, as it gives a 50% reduction in both items compared with cast iron machines.

We keep in stock and build to order, machines of any capacity, with or without interchangeable tools for punching and shearing plates, bars, squares, rounds, angle and tee irons, I-beams, etc.

Catalogue 178-10 shows the full line. ASK FOR A COPY.

We Design and Supervise the Building of Offices, Warehouses, Factories and Plants for all kinds of Industries

New Montreal Offices and Warehouse of Canadian Fairbanks-Morse Co., Ltd., Designed and Constructed Under Our Supervision.

We are Engineers and Architects. For more than twenty years we have been designing Factories, Mills, Warehouses, Steam and Hydro-Electric Plants.

We are the oldest Industrial Engineering Organization doing business in Canada. Our business is entirely confined to Canada.

Our staff is complete. It includes Architects, Mill and Structural Engineers, Civil, Mechanical and Electrical Engineers.

No project is too large for us to undertake.

It will be to your profit to consult us when you are considering the erection of a new plant or the extension of your present one.

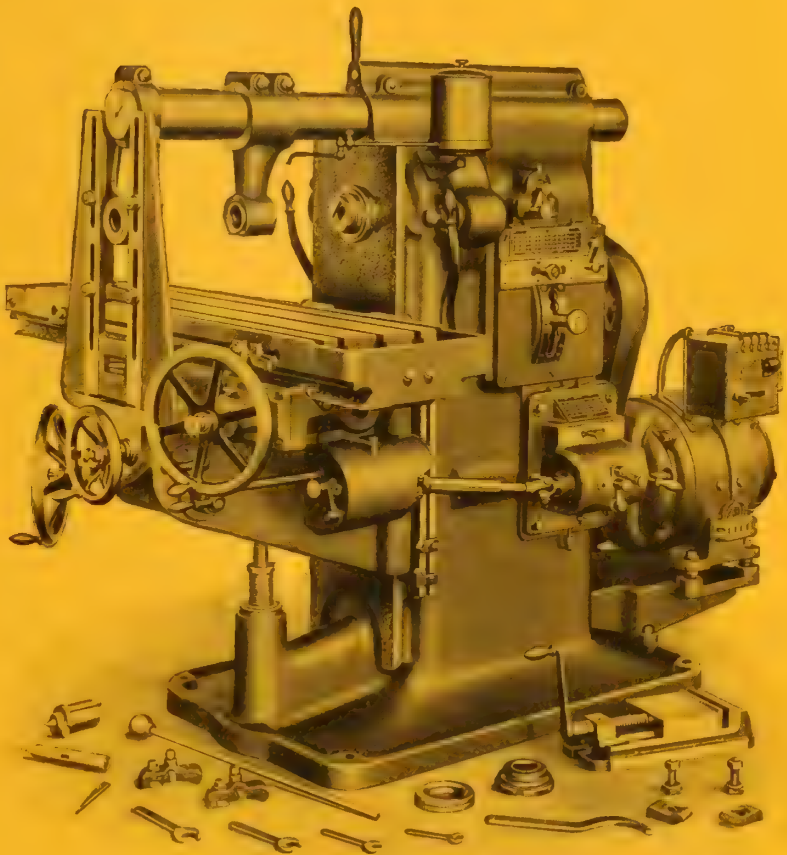
Brown & Sharpe

constant speed drive Milling Machines are designed for Heavy Service.



NOTE SOME OF THE ADVANTAGES:

1. Frame cast in one piece.
2. Large constant speed drive pulley.
3. Quickly available speed changes.
4. Friction clutch within pulley.
5. Brake connected with clutch lever.
6. Adapted to constant speed motor.
7. Independent speeds and feeds.
8. All hardened feed gears.
9. Feed screw not splined.
10. One lever starts, stops and reverses feeds.
11. Hand wheels clutched.
12. Universal, Plain and Vertical Spindle types.

They Meet the Demands of Modern Manufacturing

Large diameter constant speed drive pulley running at high speed carries an extra wide belt. The overhead pulley is also of large diameter, giving wide belt contact and powerful driving leverage. The variable feed is by means of hardened spur gears driven by chain direct, mounted on large diameter hardened steel shafts, firmly supported. Result: elimination of vibration and maximum efficiency. The knee slide extends to the top of the frame, stiffening the column and forming a massive housing for the spindle. Notice the long bearing of the knee on the column. Stout transverse ribs give the necessary rigidity for heavy service. The table is heavy and has a vertical depth that gives a stiffness to prevent springing under deep cuts. The depth of the saddle and extra long bearings in proportion to the length of the table are clearly shown. Stout, easily adjustable braces serve to firmly lock the knee and overhanging arm together, resisting the stresses that tend to produce vibration. If you have heavy milling, these features should interest you.

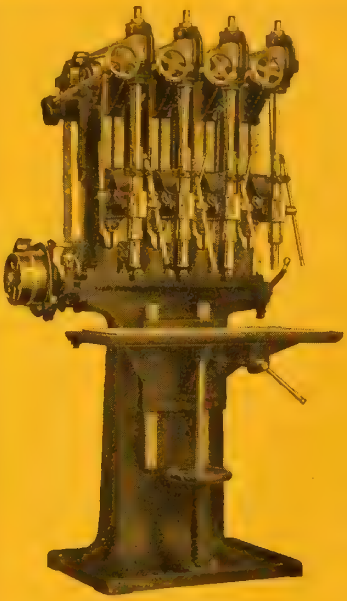
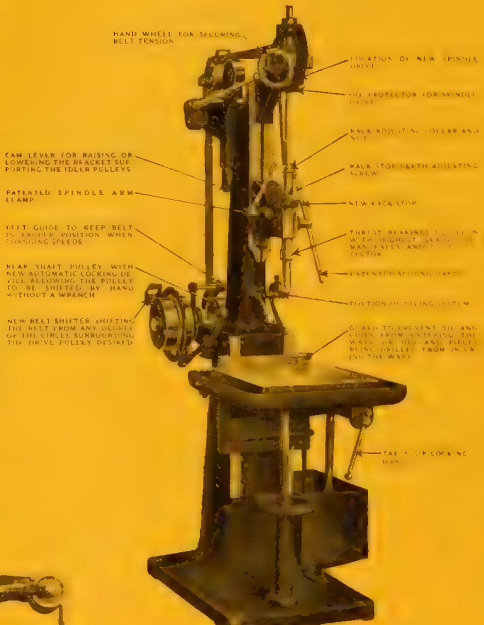
For Sensitive Drilling

The machines that hold the record for efficiency and economy.



CLASS K.

Made in 1 to 8 spindle, 8" and 12" overhangs.
Contains all the improvements and is of sufficient weight to handle most efficiently the lighter kind of manufacturing, such as typewriters, electrical supplies, etc.



HAND WHEEL FOR SECURING BELT TENSION
LOCATION OF NEW SPINDLE DRIVE
OIL PROTECTOR FOR SPINDLE DRIVE
RACK ADJUSTING COLLAR AND NUT
CAM LEVER FOR RAISING OR LOWERING THE BRACKET SUPPORTING THE IDLER PULLEYS
RACK STOP DEPTH ADJUSTING SCREW
PATENTED SPINDLE ARM CLAMP
NEW RACK STOP
BELT GUIDE TO KEEP BELT IN PROPER POSITION WHEN CHANGING SPEEDS
REAR SHAFT PULLEY WITH NEW AUTOMATIC LOCKING DEVICE ALLOWING THE PULLEY TO BE SHIFTED BY HAND WITHOUT A WRENCH
POSITION OF OILING SYSTEM
NEW BELT SHIFTER SHIFTING THE BELT FROM ANY DEGREE OF THE CIRCLE SURROUNDING THE DRIVE PULLEY DESIRED
GUARD TO PREVENT OIL AND CHIPS FROM ENTERING THE WAYS OR JIGS AND PIECES BEING DRILLED FROM INJURING THE WAYS

CLASS B.

Made in 1 to 8 Spindles, 8" and 12" overhangs.

CLASS L.

Made in 1 to 8 Spindles, 8" and 12" overhangs. Same as the Class K with exception of base construction.

CLASS H.
30" Overhang Radial Drilling Machine.

CLASS H.

Will drill holes 84" apart.
Will locate holes instantly.
Will drive efficiently drills to 1⅛".
Will drive taps effectively up to ⅝".
Ball bearing throughout with eight speeds.

CLASS I.

Our heaviest design. Will drive efficiently drills to 1⅛".

CLASS I.

Made in 1 to 6 Spindles, 8", 12" and 15" overhangs.

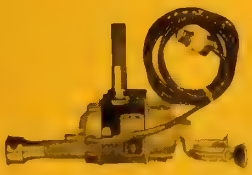
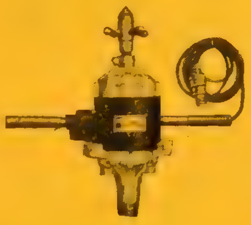
Use United States Electric Tools

If you are looking for tools to save time and labor in your shop—all motors air cooled. The U. S. Drills are being used in all up-to-date shops for drilling metal of all kinds. Get one on our free trial offer and try it out in your own shop—see the time it will save.

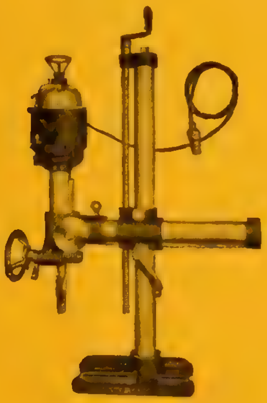


Offset Breast Drill.
Three Sizes.
3-16 in. Weight, 6 lbs.
¼ in. Weight, 9 lbs.
⅜ in. Weight, 12 lbs.

Breast Drill, Centre Spindle Type.
Two Sizes.
⅜ in. Weight, 14 lbs.
½ in. Weight, 16½ lbs.

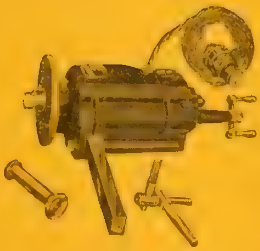


Screw Feed Drill
Three Sizes.
¾ in.—1 in.—1¼ in.
Drills these sizes of holes in steel.



Radial Drill

Made in two sizes: 0 to ⅞ in. and 0 to 1¼ in.; length of radial arm, 14 in.; length of column, 31 in.; has 5-in. power feed by hand wheel, quick return by hand, rack and pinion adjustment for radial arm. One man can operate drill. Run off of lamp socket. Portable.



Tool Post Grinder.

For grinding Centers, Cutters, Dies, Rolls and Internal and Surface Grinding. Set in Tool Post of Lathe, Plane or Milling Machine.

Wheel 4¼x½ in.

Angle Plate Grinder.
Made in Three Sizes.

Type J, ½ H.P., Wheel 8x¾ in.
Type JK, 1 H.P., Wheel 10x1 in.
Type M, 2 H.P., Wheel 12x1¼ in.
Type MM, 3 H.P., wheel 14¼x1½ in.
for grinding in Lathe, Planer or Boring Mill.

All motors are universal and may be operated on either direct current, or 25, 30 or 60 cycle, single phase, alternating current. All we need to know is whether you want the drill for 110 volt or 220 volt circuit.

The No. 20 Improved Stanley Sensitive Drill

with six spindle speeds giving a range of 600 to 2400 r.p.m.

Great care and precision is used in the construction of these drills. The spindle is ground, provided with ball thrust bearing, and is extremely sensitive. The wide base gives great rigidity. All adjustments are convenient and the machine has strength to handle the maximum capacity of drills from the smallest to ½-inch in diameter.

Now made with foot shipper in place of the one shown in cut.

High Grade Spindle Drills.

Simply and substantially constructed, they will produce the most accurate work.

The same care and precision is used in the manufacture of all of our products, and you will find these drills will back up all we have to say. Made in three sizes, two, three and four spindles, all with the same general specifications, as follows: Overhang, 7 inches, Capacity ⅝ inch, Maximum distance from spindle to table, 30 inches.

Power feed on one or all spindles.

Complete specifications will be furnished on request.

A tapping attachment can be put on any of the above spindles.

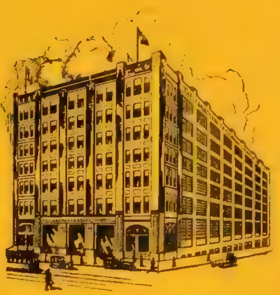
CANADA'S DEPARTMENTAL HOUSE FOR MECHANICAL GOODS

Buying "Under One Roof"
and What It Means To You



New Montreal Warehouse,
84 St. Antoine St.

You know what a great convenience it is to the general public to shop in a large department store. You know how to-day the department store is an absolute necessity because of its time-saving merchandising methods. Did you ever think what it would mean to the public were there no department stores, and how people would have to deal with a dozen or more widely separated merchants in order to get what they can now obtain under one roof?

The department store reflects the spirit of our age and is just as much a commercial necessity as the railroads, telephones and other forms of modern conveniences.

Our business is literally a large departmental house for machinery and mechanical goods, and has been evolved in obedience to the self-same economic laws that brought the department store into being. We handle a vast number of lines and have classified them into about a dozen different departments. At the head of each department is a thoroughly capable and experienced man.

You can obtain from us practically anything in the mechanical line, and on account of our being organized along departmental lines we can serve you in an efficient and economical manner. You will find it greatly to your convenience and profit to deal with "Canada's Departmental House for Mechanical Goods" rather than with half a dozen or more separate concerns.

Readers of "Canadian Machinery" are particularly interested in our "Machinery Department," but there are many other departments to which they can go whenever in the market for other kinds of supplies.

A little idea of the extent of our "Machinery" Department will be gained by looking over the five preceding pages, wherein are advertised the products of the following concerns:—Brown & Sharpe; Henry & Wright Mfg. Co.; Seneca Falls Mfg. Co.; U.S. Electrical Tool Co., and the Francis Reed Co. See also the Bertram advertisement on the front cover, and the advertisements of Pratt & Whitney; The Norton Co.; Bignall & Keeler; R. McDougall, and Wm. E. Gang Co. which will be found elsewhere in this number.

Like the general public, you too can save time and get better service by buying what you want "Under One Roof."

To Our Readers—Greetings

THIS issue of "Canadian Machinery" is dated December 25th. By this, as by a score of other tokens, you will know it is Christmas Day.

¶ We would like to meet you all personally and wish you sincerely the compliments of the season, but, being unable to accomplish the impossible, we must ask you to accept the spirit for the deed.

¶ This number of "Canadian Machinery" brings to a close the most successful year in the history of that publication, ending, as it does, its first volume in weekly form.

¶ We have striven to serve well and to merit the confidence of mechanical men and manufacturers. How well we have succeeded is for you to judge, but we believe our efforts have not gone unappreciated, and that we have been privileged to interest all and help not a few.

¶ About to enter, as we are, upon a year of potentiality, we emphasize the possibilities for profit that will be presented in each issue of "Canadian Machinery." We bespeak a careful perusal of every number that you may miss nothing and gain much; that you may be made more efficient and more completely informed upon subjects of vital importance in your work; that you may have a wider knowledge and a broader view; and that your earning power and your profits may be increased.

¶ Not only to the editorial pages do we invite your constant attention, but to the equally important preceding and succeeding pages as well—the advertising sections. Here, many of the keenest and most progressive buyers turn constantly for guidance, for information and for ideas. Here are represented the best and most reliable manufacturers, and in dealing with them you have the assurance of satisfaction in both quality and service.

¶ These manufacturers spend their money freely and judiciously that you may easily become familiar with their products. They are not afraid to get out in the clear and revealing light of publicity, because their lines can stand the most searching examination and scrutiny. You owe it to yourself to buy and use advertised goods.

¶ As we said before, we are entering upon a New Year, and, in thanking you for your support in the past, we wish you prosperity in the future, and much of it. We are preparing to do our part, and if you will do yours—the part we cannot perform for you—1914 and the years to follow will be great indeed.

NOTICE TO OUR READERS.

FOR your convenience, we have punched a hole in the upper left hand corner of this issue of Canadian Machinery, and suggest that a cord be inserted so that the number can be hung up in a convenient place in your den or office for ready reference. The Postal Regulations do not permit of us inserting the cord on account of a privileged mailing rate, but we have gone as far as is possible in an effort to co-operate with you in conserving the contents against future requirements.

RETROSPECT AND PROSPECT.

IN these closing days of the year 1913, there exists considerable divergence of opinion relative to the arrest of the trade depression tendency and to the prospects of relief from the prevailing money stringency. Canada, of course, is not alone a victim with respect to these matters, her peculiar situation as a new country in process of populating and development being more or less responsible, due to her necessary dependence for capital with which to open up her agricultural and mineral resources, and her need of the products of other countries to effectively and economically prosecute the work.

Forecasting the immediate future is after all largely guesswork, at the same time there is considerable fascination in the exercise, and no great harm, but much good usually accrues, except when pessimism is played for the sake of notoriety. The progress of the past year is such as to inspire optimism in all of us, and it is worthy of note that the record of growth and development which each succeeding twelve months is piling up makes more stable our foundations commercially, and consequently less susceptible of outside influences.

Canadian Trade.

The statement of Canadian trade for the month of November issued a few days ago by the Hon. J. D. Reid, Dominion Minister of Customs, shows that the total was $111,459,000 as compared with $106,072,000 for November, 1912. For the 8 months of the present fiscal year, ending November 30, the total Canadian trade was $777,624,000, as against $713,614,000 for the corresponding 8 months of the fiscal year 1912.

The export figures are decidedly interesting. Domestic agricultural products exported in November last totalled $33,417,000, as against $24,175,000 for the corresponding month of 1912. Exports of domestic animals and their produce was $7,795,000; and for the corresponding month of 1912 these exports were $4,939,000. The exports of manufactures for November also show a substantial and healthy increase; they were:—Domestic manufactures, $4,841,000, as against $3,830,000 for November, 1912. There is also a substantial increase in the exports of products of the mine, fisheries and forest.

For the 8 months of the present fiscal year ending November, the exports of agricultural produce easily take the lead. During this period domestic agricultural exports were $142,338,000, and for the corresponding 8 months of the last fiscal year these were $96,349,000.

During the 8 months of the present fiscal year the exports of domestic animals and their produce was $38,824,000, compared with $33,949,000 for the corresponding period of 1912. The fisheries were never in a more flourishing condition. For the 8 months of the present fiscal year we exported of domestic fish 13,556,000, compared with $10,499,000 for the corresponding 8 months of 1912.

Imports for November, exclusive of coin and bullion, were $50,202,000, made up as follows: Dutiable goods, $32,338,000; free goods, $17,863,000. For the corresponding month of 1912 the imports were: On dutiable goods, $38,471,000; free goods, $20,846,000—making a total of $59,318,000. The imports for the 8 months ending November 30 were: Dutiable goods, $294,635,000; free goods, $146,111,000—making a total of $440,746,000. For the corresponding 8 months of 1912, the imports of dutiable goods were $293,319,000 and of free goods $152,231,000, making a total of $445,550,000.

The grand total exports for November were $57,762,000 and the grand total imports of dutiable and free goods $50,202,000. During the month of November last we imported $1,814,000 of coin and bullion and the imports of coin and bullion for the 8 months ending November 30 were $5,422,000, compared with $3,634,000 for the 8 months of the previous fiscal year.

One of the most pleasing exhibits made by these figures is the fact that Canada's exports are increasing so rapidly. No doubt, the huge crop in the West has contributed a large quota, but an examination of the various classes of exports shows that there has been considerable expansion over many departments.

Railroad Development.

During the present year a large increase in mileage under construction and in operation falls to be recorded, and, concurrently, the features of rolling stock and contributory equipment and the opening up of new territories to agricultural, mineral, and general industrial development, combine to make the achievement still more marked.

Whatever be the degree of financial stringency, the railways are bound to keep up their efficiency to the highest possible standard. Slackness or indifference in this direction would be fatal. Figures show that the C.P.R., the Grand Trunk and the Canadian Northern have between them ordered 1,000 locomotives during the past twelve months, together with 43,000 freight cars.

This, in turn, relates to other big things. For instance, the wheat acreage has increased in Manitoba during the past ten years 1,000,000 acres, or 48 per cent.; in Alberta, for the same period, 1,520,000 acres, or 4,647 per cent.; in Saskatchewan, 4,235,000 acres, or 48 per cent.; and in the total wheat area in the Western Provinces, 6,768,000 acres, or 269 per cent.

Work on the G.T.P.-National Transcontinental railroad has been pushed forward on an extensive scale during the year and what is true of laying steel applies also more or less to the preparations made to care for the rolling stock and equipment. At Transcona, near Winnipeg, the locomotive repair plant has been in operation, while the car plant is rapidly nearing completion. At Prince Rupert, B.C., the Western terminal, drydock construction, marine and locomotive plants show material development. Plans have also been prepared and contracts let for the locomotive and car repair shop of the Eastern division at St. Malo, near Quebec, and during the coming year tenders will be sent out and contracts placed for the engineering equipment. Work on the Quebec Bridge which forms part of the Eastern section of the N.T.R. is being pushed forward, and while completion of the structure will be somewhat later than the opening of the railroad for traffic, provision has been made to meet this eventuality by the letting of a contract to Cammell, Laird & Co., Birkenhead, England, for a ferry vessel capable of taking a full train aboard. This craft will be launched towards the end of January, 1914, and will bear the name "Leonard," after the N.T.R. Commissioner.

Our third Transcontinental, the Canadian Northern, has been no laggard in the matter of accomplishment during 1913, and when we stop to consider the magnitude of and cost involved in the work of throwing a track of steel across a continent, there is naturally aroused a secret admiration for the men whose enterprise and determination make possible the achievement.

The Dominion Government Railway, perhaps better known as the Intercolonial, operating from Montreal through the Maritime Provinces to Halifax has, during the year, spent much in the improvement, both of its repair plants and rolling stock, and it is not overstraining the point, when we state that at no time in its history has this railroad been in such good shape.

Montreal Grain Export.

The export grain trade from the port of Montreal for the season 1913 has been a record one. The total shipments of all kinds of grain amount to 54,305,172 bushels, as compared with 38,918,264 for the season 1912, showing the handsome increase of 15,286,908 bushels, which to a large extent may be attributed to the remarkable improvements made within the past few years in the facilities of handling grain at the port. The elevator capacity has been increased considerably, and this, coupled with the cheaper all-water rates for grain from Fort William and Port Arthur and the splendid service obtainable from the different Lake lines of steamers, induced exporters to forward all the grain they possibly could by way of Montreal. Notwithstanding these facts, some very large quantities were also exported via United States ports.

The Steel Trade.

Considerable inconvenience was felt throughout the year by most people engaged on general and structural engineering work, through delays in steel deliveries from the mills, the latter having been easily loaded up beyond their capacity. The above mentioned conditions are, however, now less acute, due to the money stringency and consequent easing up of business generally. Dissatisfaction is still expressed with the inaction of the Dominion Government relative to the matter of bounties or tariff imposts for the support of the various steel concerns throughout Canada and general expectations are that something really helpful in one or other of these directions will materialize in the course of the ensuing year.

Workmen's Compensation.

The report of the Province of Ontario Commissioner, Sir Wm. Meredith, on workmen's compensation indicates, from the expressions of opinion by what might be termed opposing interests, that not only will a more or less bitter fight be waged when the Bill for enactment comes before the Legislature, but that some more rational means of arriving at a mutually satisfactory solution of the necessarily knotty problems involved might have been adopted.

Representative Manufacturing Plants.

This issue of Canadian Machinery contains a series of articles descriptive of representative manufacturing concerns intimately allied with the trade and practice of mechanical engineering, and serves to show the extent and scope of the work undertaken. Developments of note during the year in the matter of new industries and product, are exemplified in the "Leonard" vertical, forced lubrication, quick revolution engine; the manufacture of hack saws, two plants having been established, one in Hamilton and one in Montreal. Twist drill manufacture has come to the front during the year, the companies interested being the John Morrow Screw Co., the Wilt Twist Drill Co., and the Armstrong-Whitworth Co. Electric Welding machinery and equipment manufacture by the Fisher Motor Co. and the Agnew Electric Welding Co., both of Walkerville, Ont., are industries to which 1913 has also given birth.

General.

The succesful boring of the tunnel through Mount Royal by the engineering staff of the C. N. R. and the completion of the C. P. R. bridge across the St. Lawrence at Highlands, near Montreal, can be reckoned as among the Dominion's great engineering feats during 1913.

INDUSTRIAL NOTABILITIES--No. 14

ARTHUR WILLIAM WHEATLEY, Vice-President and General Manager of the Canadian Locomotive Co., Ltd., Kingston, Ont., and previously connected with many of the most important railroads of America in various capacities, covering a period of seventeen years experience, was born October 12th, 1870, at Ashford. Kent County, England. He is a son of William Wheatley, who is still doing business in England as an iron founder, and of Agnes (Holly) Wheatley, both of English birth and ancestry. After receiving an ordinary education in the railroad schools of Kent County, England, young Wheatley, at the age of fifteen years, began as a rivet boy in the shops of the South Eastern Railroad, and in 1887 apprenticed himself as a fitter, attending night school—operated by the railroad company.

In 1892 he went to the United States, and soon found employment with the Northern Pacific Railroad at Brainerd, Minn., as machinist. In 1893 he was transferred to Staples, Minn., in the like capacity. In 1895 he was made foreman, occupying that position until 1900, when he was transferred to Livingston, Mont., as general foreman. In December, 1902, he was promoted to master mechanic of the Yellowstone division, headquarters at Glendive, Mont.

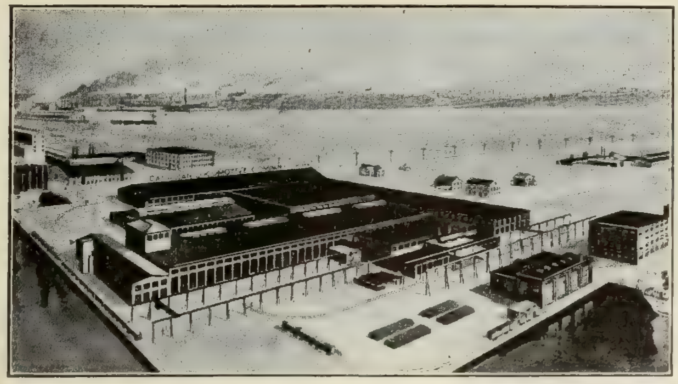
In June, 1903, he was appointed shop superintendent at Brainerd, Minn., and in April, 1904, was made general master mechanic of the entire system of the Northern Pacific Railway. About February, 1905, he accepted a position on the Rock Island Railway as shop superintendent at Moline, Ill., and in June, 1906, he became assistant mechanical superintendent on the Union Pacific Railroad, with headquarters at Omaha. In June, 1907, he entered the employ of the American Locomotive Co. at Schenectady as general inspector of the various plants, and in December of the same year was transferred to Montreal as manager of the American Locomotive Co. plant in that city.

ARTHUR WILLIAM WHEATLEY.

In November, 1910, he was transferred to Dunkirk, N.Y., being in charge of that plant until June, 1911, when he received and accepted an offer from the Canadian Locomotive Co. at Kingston, Ont., and was chosen as Vice-President and General Manager of that large corporation, a position he ably fills at the present writing.

Mr. Wheatley was married July 1, 1894, to Eleanor Daglish Edwards, of Brainerd, Minn., and the union has been blessed by two sons, Henry William Wheatley, and Arthur Walker Wheatley.

Mr. Wheatley is a member of the St. James Club, Montreal Club, Engineering Club of Montreal, Royal St. Lawrence Yacht Club of Montreal, Frontenac Club of Kingston, and of the Masonic Fraternity, being a Knight Templar and a Shriner. He resides in Kingston, and his principal recreation is golf.



Rebuilding the Canadian Locomotive Works - Kingston, Ont.

Staff Article

What follows shows how a thoroughly modern locomotive works is being evolved from a plant that was constructed long before the lay-out of industrial plants had become the almost exact science that it is to-day. It is interesting to note that, so far from falling behind, production has actually been materially increased during the reconstruction of these shops.

THE works of the Canadian Locomotive Co., Ltd., at Kingston, Ont., are the oldest in Canada devoted to locomotive construction, dating back more than sixty years. They were established in 1850 and were taken over by the present company, organized by Mr. Aemilius Jarvis, of Toronto, in 1911.

A large amount of money has been spent in the modernization of the plant, and where the production two years ago was barely six engines per month it is at the present time twelve; and when the improvements and betterments which are now being proceeded with are completed, the output will be increased to twenty-five locomotives per month.

The problem of how best to remodel the works was one beset with difficulties, not the least of which was the restricted nature of the site of the existing plant. This site, however, it was decided to retain, as it is possessed of several important advantages. It has excellent track connections with the Grand Trunk Railway and lies on the shore of Lake Ontario, with unloading slips on two sides of the plant, enabling raw material to be brought in by water.

The first step in rebuilding was to get out plans for the new shops to be erected over and around the old ones, that being the only way in which production could be continued during the alterations. This work was entrusted to the firm of Henry Goldmark, consulting engineers, New York. The preparation of detail plans and specifications and the carrying out of the work is in charge of Mr. C. J. Goldmark, a member of the firm. Good progress has been made, the new carpenter and pattern shop, pattern storage, foundry, tank and tender shops being now completed. The pits in the new erecting shop are also built and the foundation work finished; and erection of the steel work is now going forward. A plan of the works as they will eventually appear is shown, and from this the relative positions of the different shops can be clearly seen.

The Pattern and Carpenter Shops.

This is the latest shop to be completed, and went into operation in October last. It is a one-storey building with brick and concrete walls, steel frame, steel roof trusses and purlins, and 3-inch wood roof. It measures approximately 193x60 ft.One-half of this space is used by the carpenters and the other half by the pattern-makers, the two sections being separated by two dry kilns and a boiler room which occupy the middle of the shop. Large steel sash windows and glass skylight give good natural lighting, mercury vapor lamps being used after dark. The building is heated by a hot blast system, a motor-driven Sturtevant fan distributing air heated by steam raised in a return tubular boiler. The latter is fired entirely by shavings, scrap lumber, etc. All machines are fitted with exhaust hoods over the cutters, or where this is not feasible, with floor sweep openings. In this way shavings and sawdust are carried to a dust separator above the boiler room roof, and from there are fed into the furnace. If the exhaust fan is delivering the shavings to the separator faster than they can be burned in the furnace, the surplus is

INTERIOR OF PATTERN SHOP.

automatically passed to a storage receiver inside the boiler room. From here the shavings fall to the floor and are fed to the furnace by hand as required.

Sanitary bubbling drinking fountains are stationed at various points in the shops and modern toilet requisites are provided above the dry kilns, thus economizing floor space. There are two dry kilns, one for each department. They are heated on the same system as that employed for warming the shop; but not by the same heating installation. A small Sturtevant unit for this purpose is located on top of the kilns behind the lavatories. The whole shop is fitted with a sprinkler system, the inside of the kilns being also similarly equipped.

In the carpenter department, the more important machines are motor-driven, the remainder being arranged in groups driven from shafting. The main line shaft and jack shafts run in Chapman double ball bearings. The following makers supplied the bulk of the machines in the carpenter department: Greenlees, Brothers Co., Berlin Machine Works, Ltd., Canada Machinery Corporation, Ltd., and Oliver Machinery Co.

In the pattern shop, every machine has an individual motor drive, and the glue pots are heated by electricity. The bulk of the equipment was supplied by the Oliver Machinery Co., Grand Rapids, Mich., and includes two saw benches with universal saw guards, combination saw (rip and cross cut), 26-inch single surface planer, three patternmaker's lathes with variable speed motor-driven heads, universal pattern lathe taking work 8 ft. diameter by 8 ft. long, Besly motor-driven disc grinder, etc. A small

GENERAL PLAN OF SHOPS, CANADIAN LOCOMOTIVE CO., KINGSTON, ONT.

bench trimmer is provided for every two men, and the shop is splendidly fitted out in every way. In fact, it is probably one of the finest pattern shops in Ontario, if not in the Dominion.

Adjoining it is a six-storey pattern storage building, equipped with sprinkler system and hose stands on each floor. An Otis-Fensom elevator serves the building, which covers an area of 74 ft. by 61 ft. The heavy patterns are stored on the ground floor while the remaining floors have the usual racks and shelves. The aisles are illuminated by Tungsten drop lights, lamps on extension cables also being available.

The Foundry.

Though the new foundry is not adjacent to the pattern shop, its description follows logically upon that of the latter. It went into operation at the beginning of June, 1913, being the second of the new buildings to be completed. It is a steel frame building with brick curtain walls, and is approximately 242 feet long, with a maximum width of 158 feet. It consists of the usual three bays together with a crane runway on the east side, which is roofed in for use as a storage bay. The crane is a 10-ton Whiting, equipped with an Electric Controller and Mfg. Co. magnet. The runway extends 125 ft. past the end of the foundry to the north and crosses the yard trackage system. Pig iron and scrap can thus be rapidly unloaded from the cars by the magnet and conveyed to the other end of the bay, which is there entirely closed in. The runway will eventually be extended to the south boundary of the lake.

Industrial tracks run along the inner side of this storage bay from the lower end of the charging platform. Coke is shovelled onto the trucks, and the scrap iron and pig are loaded up by the magnet. The trucks are then run forward to a small platform scale and after weighing are raised by the travelling crane to the charging platform, which is of steel plate. The wheel base of the trucks is very short and the wheel flanges, instead of being rounded, are square. This enables the trucks to be readily run across the steel platform without the use of rails, the short wheel base causing them to ''steer'' easily.

There are two Whiting cupolas, sizes No. 3½ and No. 7. Blast for the latter is supplied by a No. 5½ Roots blower driven by a Canadian Westinghouse variable speed motor of 30 H.P. The smaller cupola is served by a Sturtevant No. 7 high pressure blower, belt driven by a Canadian Westinghouse 15 H.P. motor. These blowers are located on the mezzanine floor seen below the charging platform in the cross section of the foundry. The speed of the Roots blower can be varied by a master controller affixed to the front of the cupola within easy reach of the tapping platform, thus enabling the blast pressure to be varied at will. There is also telephonic communication between tapping platform and charging floor. On the ground floor of the cupola room there is a Whiting cinder mill driven by a 6 h.p. Canadian Westinghouse motor.

To the south of the cupola room is the core department, which is equipped with two ovens, 14 ft. by 11 ft., and 9 ft. by 14 ft. respectively. Both are fitted with tracks for core trucks and are served by a 5-ton Whiting electric jib crane, which also covers the cylinder pits in the main bay. Small cores are dried in two Whiting 3 ft. by 6 ft. drawer ovens. The firing pit is located behind the ovens and inside the cupola room, coke being the fuel used. For dry sand moulds there are two ovens on the opposite side of the cupola room. These measure 17 ft. by 10 ft., and are served by a 5-ton jib crane.

The remaining portion of this east bay is occupied by a cleaning department for the smaller castings. This room is served by a 3-ton floor operated Whiting electric travelling crane and is equipped with two Whiting tumbler mills, fitted with dust collectors, exhauster and piping. The mills are driven from a line shaft, and may be

MAIN BAY OF FOUNDRY LOOKING SOUTH.

run together or separately. A Canadian Westinghouse 20 h.p. motor drives this shaft and also the exhauster fan, which is a No. 5 Sturtevant. Further equipment in this room includes a core wire straightener and a motor-driven double emery grinder.

INTERIOR OF BOILER SHOP.

Behind the main cleaning room is a chipping room and sand blast room. Here the larger castings are cleaned. They are brought in on the industrial tracks shown in the plan, and after the fins have been chipped off are taken into the sand blasting room. This contains a No. 8 Pangborn high pressure sand blast machine. The flying sand is collected by an exhaust head and Sturtevant fan driven by a 3 h.p. Crocker-Wheeler motor. The sand is afterwards passed through a Pangborn separator and used over again. Adjacent to the sand blast room are the sand storage bins. These are of brick construction and have the toilet rooms arranged on top of them. The bins are of course filled by the runway crane.

The main bay of the foundry is 53 feet wide and is spanned by a 10-ton Whiting crane and it is intended to add a second crane of 15-tons capacity at a later date.

INTERIOR OF TANK SHOP.

The crane runway has been extended 183 feet beyond the south end of the foundry to the water front. This runway is at present being used for storage of flasks, and during the past summer many of the larger castings were cleaned there, but it will eventually be closed in to form a sheet iron shop and cabs, jacket work, etc. will be done here. This shop will be served by a 10-ton Whiting crane. Running parallel with it, and forming an extension of the east bay of the foundry, there will be a superheater shop 168 feet long, also served by a travelling crane. Here the superheaters, which have now become almost an essential feature of the modern locomotive, will be assembled and tested previous to passing to the erecting shop.

Returning now to the foundry, the west bay next calls for notice. This bay is some 60 ft. shorter than the main bay, a chamber having been built out into it from the tank shop for sand blasting tender tanks. Another 20 feet are occupied by racks for storage of patterns that are about to be used on the floor. Most of the space in this west bay will eventually be occupied by molding machines, the equipment not having yet been finally decided upon. The only machine so far installed is a Davenport jar ram, roll-over and pattern drawing machine of 750 lbs. capacity. A 3-ton floor operated Whiting electric travelling crane serves this bay, and there is an exactly similar crane in the east bay.

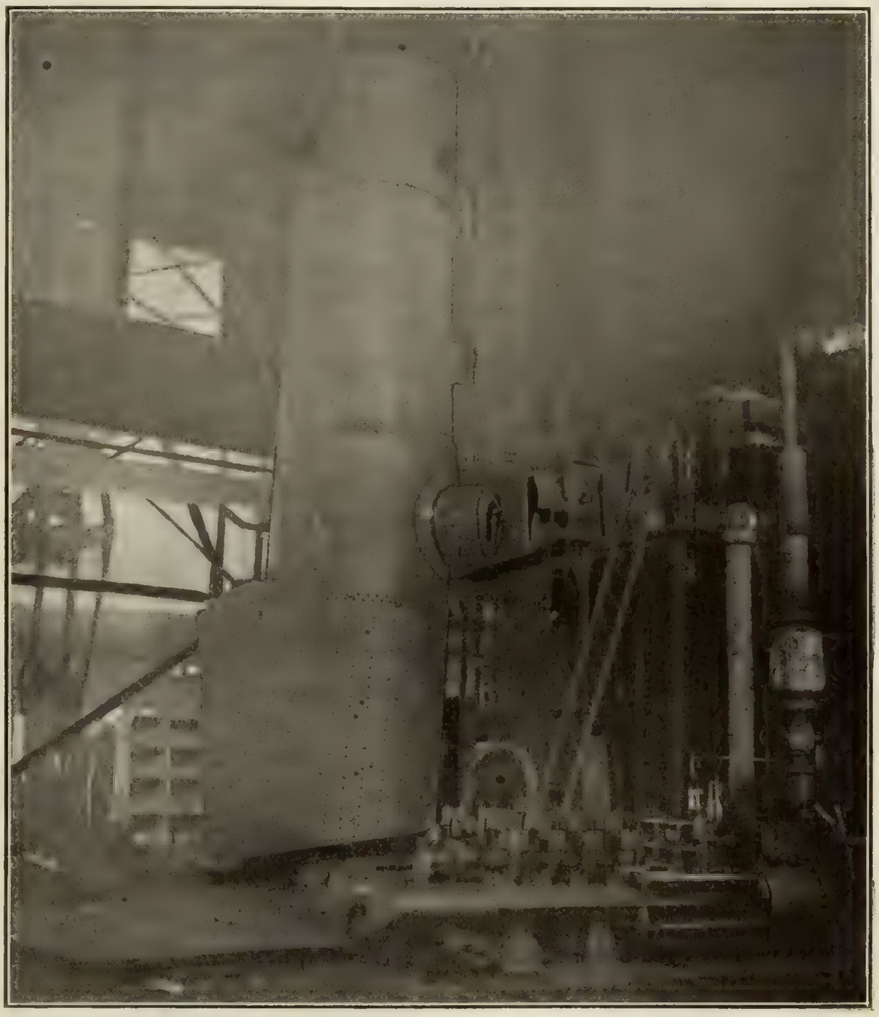
At the north end of the west bay a space 40 feet long by the full width of the bay has been partitioned off to form a brass foundry. The floor is of concrete and the equipment consists of two pit furnaces, and an oil-fired tilting furnace, portable core oven, band saw, wet tumbler and a 1-ton jib crane.

The foundry is heated on a hot blast system, exhaust steam from the power house being utilized in the usual coils, through which cold air is drawn by a Sturtevant motor driven fan. The warmed air is delivered into large overhead sheet iron ducts extending down each side of the foundry. At intervals there are down drops terminating in two, or in some cases three legs delivering warm air at about 8 feet above floor level. From here it rises into the monitor over the main bay and escapes through the opening sash frames carrying away the gases and dust with it. The layout of the ducts has been very carefully arranged to give a comfortable temperature in every part of the foundry. The sand bins are also heated to eliminate the risk of their freezing up in winter. Artificial lighting is by Cooper-Hewitt quartz arc lights in the main bay, incandescent drop lights of 50 c.p. being used elsewhere.

A continuation of the west bay beyond the tank sand blast room forms a crane-served runway where the scrap bins are located. By means of a magnet the scrap is readily loaded into cars which are brought in on the track running across the site a short distance south of the foundry. Scrap is conveyed to the bins from the boiler and tank shop on trucks running on this same track.

Tank and Tender Shop.

This building stands on a previously unoccupied site and was consequently the first of the new shops to be built. In making this statement, the boiler shop is excepted. The latter is really a new building, being not much more than two years old; but it was completed before the present scheme of rebuilding the entire plant was undertaken, and must hence rank as one of the "Old" shops. It is thoroughly up-to-date in every way, however, and there is no intention of re-modelling it, though an addition will be made to it, as explained later.

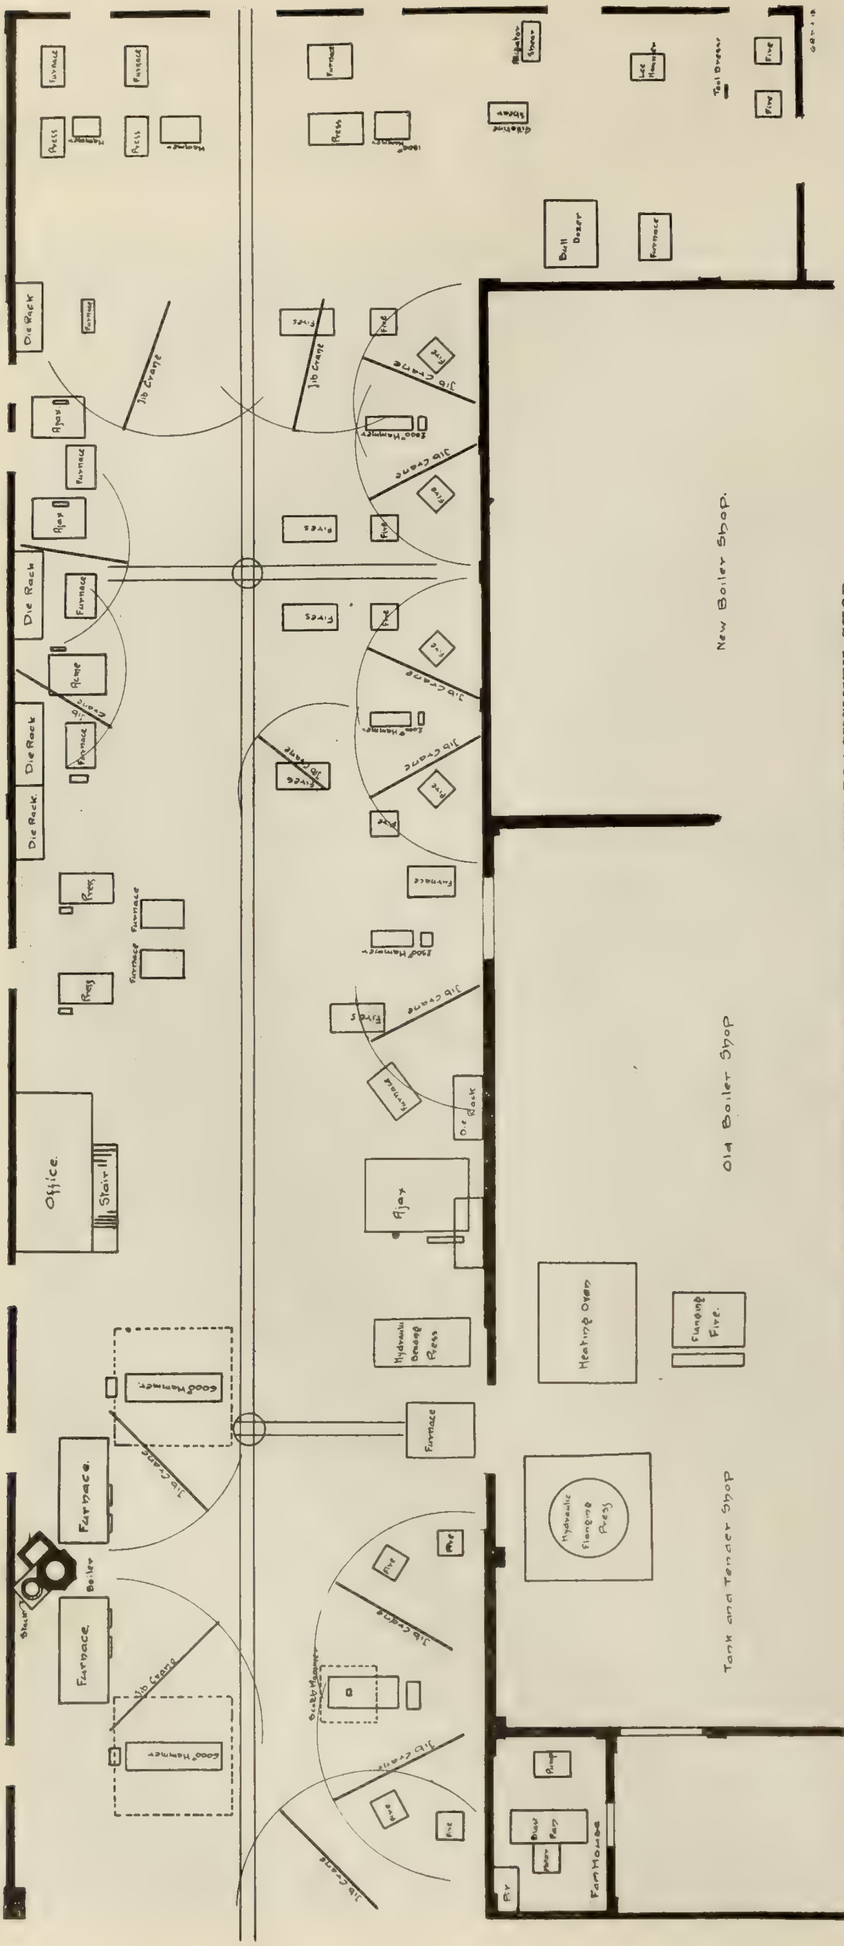


LOCOMOTIVE BOILER SUSPENDED OVER HYDRAULIC RIVETER.

The new tank and tender shop is 397 feet long by 67 feet wide. The engine and tender trucks, tender tanks and tender frames are fabricated here; also cab and ashpan work, pending construction of the new sheet iron shop. Truck work is done at the north end of the shop, angle and plate work at the south end, and tender tank and frame building in the centre.

The shop is served by a 20-ton double trolley 5-motor Cleveland crane and also by a 10-ton Whiting crane, this service being supplemented where necessary by Whiting jib cranes fitted with electric hoists. Flanging is done on a 600-ton four column hydraulic press having 12 ft. clearance. This was built by R. D. Wood & Co., Philadelphia, and is served by a 12 ft. by 8 ft. oil fired Ferguson furnace. This press is, of course, principally employed on boiler work, but is located in the tank shop for convenience at present.

Most of the machines in this department have individual motor drives, though a few along the west side are belt driven from shafting. The equipment is of a standard character and includes, in addition to the usual shears and punches, an automatic spacing punch, Hilles and Jones horizontal



LAYOUT OF MACHINERY AND EQUIPMENT IN NEW BLACKSMITH SHOP.

punch, and angle iron shears. There is also a very fine 48-in. x 48-in. x 14 ft. Cincinnati planer fitted with a Lancashire reversing motor drive. The tools for truck work are located towards the north end of the shop and include double travelling head slotter, double travelling head shaper, 60-inch American radial drill, Bertram 42-inch car wheel boring machine, 42-inch Bullard boring mill, Bertram double axle lathe, Newton double spindle drill, etc. Truck wheels are forced on their axles by a 250-ton hydraulic wheel press, served by a jib crane with electric hoist.

Natural lighting in the tank shop is by nine transverse monitors fitted with continuous swinging sash. Cooper-Hewitt quartz arc lamps furnish artificial light. The shop has a floor of creosoted wood blocks laid on edge. Heating is by the hot blast system as in the foundry, pattern shop, etc.

The Boiler Shop.

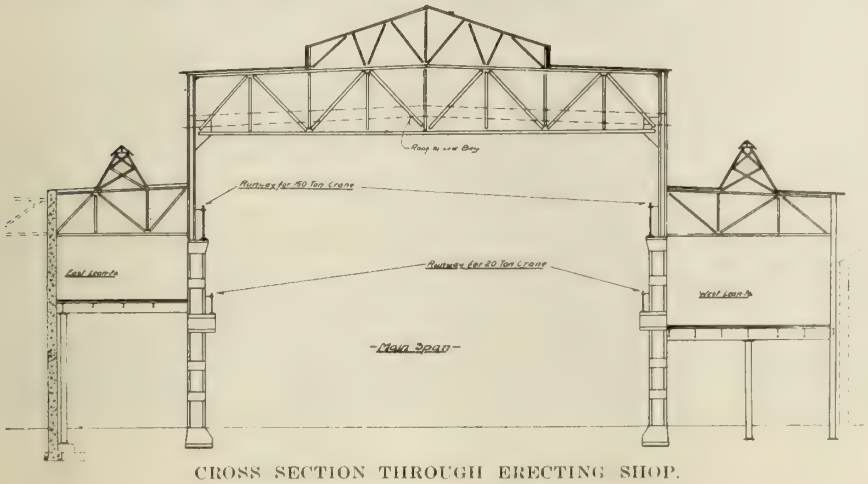
As previously stated this shop is about two years old and does not enter into the present scheme of reconstruction. It will, however, be extended by the addition of an L at the south-west corner when the new erecting shop is completed. The shop is parallel to and of the same length as the tank shop. It has a width of 60 feet, and the L addition will cover an area of 123 ft. by 76 ft. The main shop is a steel framed structure with concrete walls. Side windows and large skylight areas give good natural lighting, artificial illumination being by Cooper-Hewitt quartz arc lamps. The whole area of the shop is served by two Shaw 20-ton cranes, one of them being equipped with an auxiliary 5-ton hoist.

Boiler riveting is done at the south end of the shop, where there is a hydraulic gap riveter, accumulator and Snow pressure pump. The riveter and accumulator were supplied by the Chambersburg Engineering Company. The riveter has a depth of gap of 14 ft. 6 inches and is of the multiple pressure type. Pressures of 25, 50, 75, 100 or 125 tons can be exerted according to the size of rivet being closed, the water pressure used being 1,500 lbs. per square inch. The riveter is served by a hydraulic crane, which was also made by the Chambersburg Engineering Company.

A large proportion of the machine tools in the boiler shop have individual motor drives. Included in these are Hilles and Jones heavy plate bending rolls, Cleveland punches and shears, Bertram punches, Newton cold saw, Ryerson high-speed friction saw, etc., etc. There are two plate edge planers with capacities up to 15 feet and 20 feet respectively. The latter is a very fine tool by Dempster, Moore and Co., Ltd., Glasgow, Scotland, and is fitted with pneumatic clamps for holding down the work. Further equipment includes a Bertram motor-driven horizontal punch, Newton 3-spindle mud ring drill, a Lassister 6-spindle staybolt machine, and two Bertram radial drills. This shop differs from most of the others in being heated by direct radiation.

Blacksmith Shop.

The new blacksmith shop is not yet built. It will occupy a position south of the boiler and tank shops and will be in the form of an L. The shop will have a length of about 274 feet and a width above the L of 67 feet. The foot of the L will measure 115 ft. by 40 ft., and will be used chiefly as a drop hammer shop and tool dressing department. At present drop forging work is being done in a small frame building near the old blacksmith shop. The present equipment for this work consists of one 1,400-lb. steam hammer by the Erie Foundry Co., one 600-lb. drop hammer by Billings and Spencer, one blanking and one trimming press by E. W. Bliss and Co., and two Ferguson oil furnaces. When the new shop is completed this equipment will be considerably increased.



CROSS SECTION THROUGH ERECTING SHOP.

VIEW ON GROUND FLOOR OF OLD MACHINE SHOP.

Much of the equipment in the main leg of the new blacksmith shop will also be new, while the balance will be transferred from the old shop. The heavy work will be done under two 6,000 lb. double frame hammers, served by 3-ton jib cranes and large double door furnaces. The latter will burn coal, and will be fitted with American underfeed stokers, the waste heat being used to raise steam for the hammers in a vertical boiler. Along the south side of the shop two Bradley hammers and three forging machines, with their attendant oil furnaces, will be arranged. There will be one 1½ inch Acme and two 2 inch Ajax machines, with racks for storage of the dies ranged against the wall close by. For heavier work there will be a 5 inch Ajax machine on the other side of the shop.

The arrangement of the lighter hammers along the north side is of considerable interest. Instead of the fires and hammers being arranged in parallel lines, as is so commonly done, each hammer is located in the centre of a semi-circle of fires. This is not a strictly accurate description of the arrangement, but will serve sufficiently to convey the idea. It makes a very compact layout, and results in practically every fire having jib crane service. The hammers are all of the single frame type, there being two of 2,000 lbs. and one of 2,500 lbs., by the Morgan Engineering Co., and one of 3,400 lbs. by Glen & Ross. The fires will all have hoods leading to an overhead flue, from which the gases will be drawn by an exhaust fan. This shop will be lighted by quartz arc lamps. An annex at the north-east corner of the shop accommodates the blast fan and also the oil pump for distributing fuel oil throughout the various shops. Here also are the heating fan and coils for the blacksmith and hammer, sheet iron and superheater shops.

The Erecting Shop.

The new erecting shop is parallel to the boiler shop and has fifteen transverse pits pitched at 17 feet centres. It is of course a steel framed structure and has three bays. The main bay is 275 feet long by 80 feet wide and is served by two cranes. One of these is a 175-ton crane by the Morgan Engineering Co., and is designed for 25 per cent.

overload. It has a 10-ton auxiliary hoist and is of the double trolley, six motor type. This runs on the upper runway, the rail level of which is 39 feet 6 inches above the floor. Below this there is a second runway on which a 20-ton double trolley Cleveland crane operates. The rails of the locomotive pits are laid on concrete walls and are held down by steel clips. Each pit has three electric light sockets and three connections for compressed air.

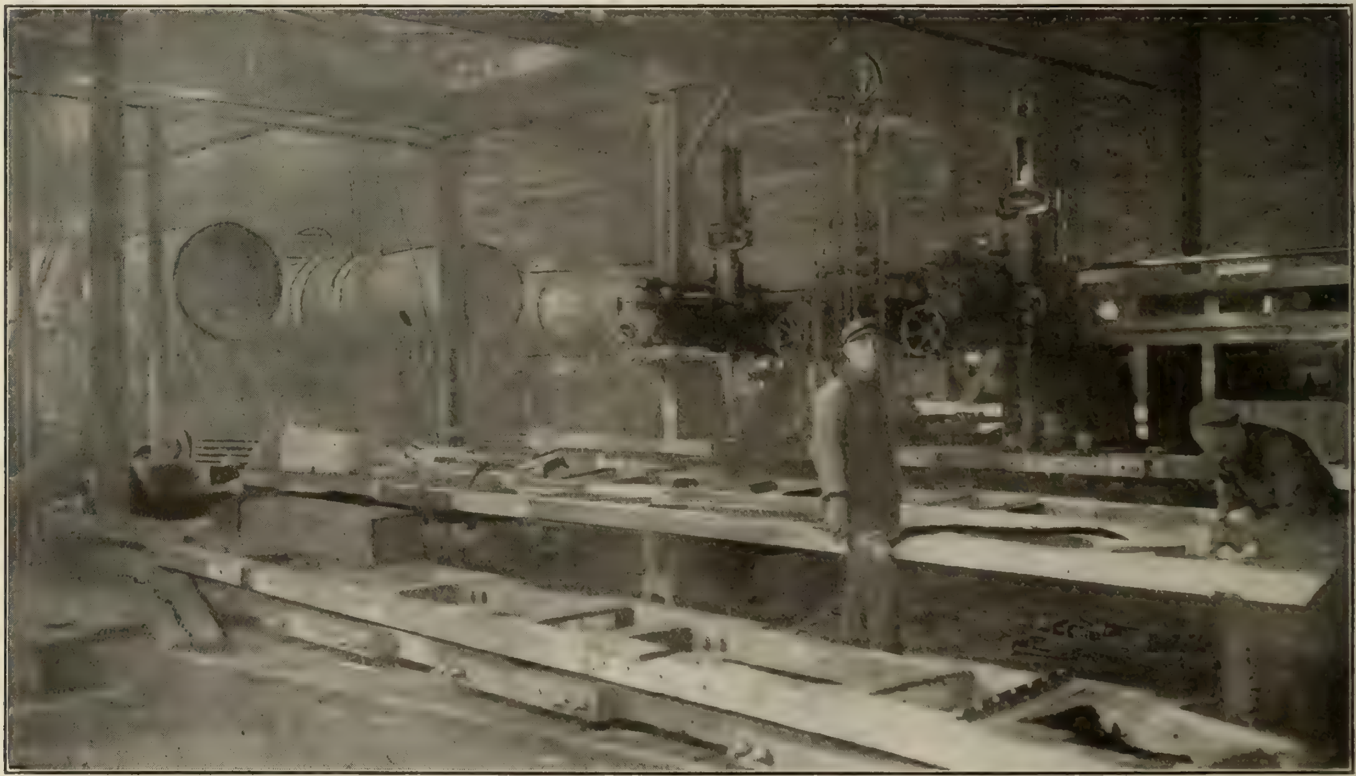
PLAN OF CARPENTER AND PATTERN SHOPS.

Both side bays have a gallery overhead in which will be located pipe shops, electrical department, tinsmith shop, paint room, lavatories, etc. The east bay extends the full length of the shop, but the west bay stops short at the column between the tenth and eleventh pits. Access to and from the old machine shop is had by a standard gauge track to the north of No. 1 pit. Mounted wheels and axles will be rolled in from the machine shop on this track and carried to the necessary pit by the 20-ton messenger crane. When an engine has been wheeled it will be lifted by the 175-ton crane and placed on No. 1 pit which is in direct communication with the yard trackage system.

Cooper-Hewitt quartz arc lamps will be used in this shop, supplemented by incandescent drop lights where necessary.

Machine Shops.

As may be seen from a study of the plan of the works, there are two machine shops, arranged in the form of an L. The new machine shop at present forms the erecting shop, some of the heavy machine tools also being located here. However, on completion of the new erecting shop, this building will be pulled down and rebuilt as a steel-framed structure of thoroughly modern design. It will be served by two 10-ton travelling cranes and will provide accommodation for most of the heavier machinery, such as frame-planers, frame-slotters, etc. These tools already occupy part of this site, but are very much crowded together and have only jib crane service. Wheel and cylinder work will also be done in this shop. Among the more important tools now to be seen in the present shop may be mentioned a Newton 4-spindle frame drill, Bertram triple head frame slotter, and heavy planers with Lancashire revers-



DRILLING AND FITTING LOCOMOTIVE FRAMES. THESE ARE DRILLED IN BATCHES OF FOUR AT A TIME.

ing motor drive by Bertram and the London Machine Tool Co.

SECTION OF FOUNDRY SHOWING CUPOLAS, CORE AND DRYING OVENS.

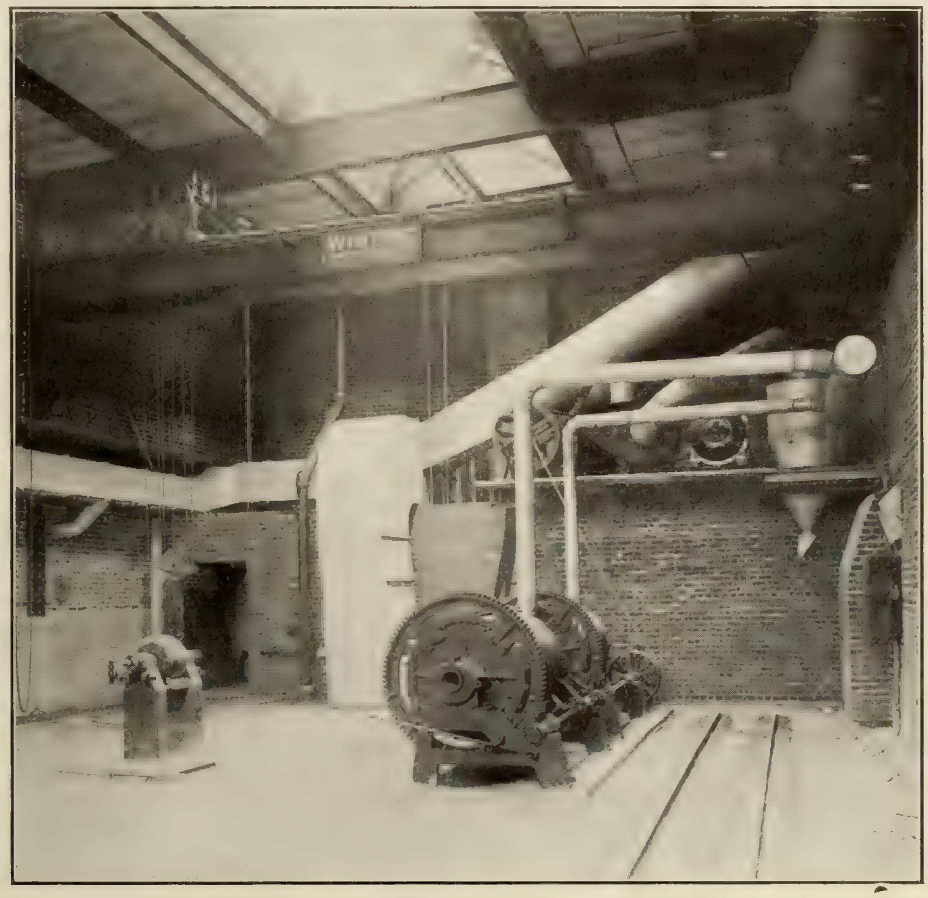
The old machine shop runs parallel with the new erecting shop and is a two-storey stone building, 324 feet long with an average width of 56 feet. With the exception of the frames all the machine work is at present being done in this shop. On the upper floor are located the lighter tools together with the bolt department, tool room, etc.; while downstairs the heavier work is carried out. When the new machine shop is built, many of the tools will be transferred there, particularly those employed on cylinder and wheel work. At present wheels and axles are handled at the north end of the lower floor. The tools for this purpose include a Bertram 84-inch motor driven wheel lathe, Bertram motor driven quartering machine, Bertram 84-inch tire boring mill, Bertram 300-ton hydraulic wheel press, Niles double axle lathe, etc.

No useful purpose would be served by enumerating all the machines in the shop, but that they are all of the highest class may be gathered from the following partial list of makers:—Bertram, Bullard, Newton, Niles, Canada Machinery Corporation, Wm. Sellers, Inc., American Tool Works, Alfred Herbert, Morton Mfg. Co., Cincinnati Planer Co., Pratt & Whitney, Windsor Machine Co., Potter & Johnston, Jones & Lamson, Landis Tool Co., Cincinnati Milling Machine Co., R. K. LeBlond, Gould & Eberhardt, Brown & Sharpe, Geo. Richards & Co., Clifton & Waddell, W. F. & John Barnes, H. G. Hammett, etc., etc.

There are three Newton heavy vertical millers for main and side-rod work, one of these also being used for milling the corners of mud rings. For milling or fluting rods there are two heavy slab millers, one by Bertram and the other by Newton. Axle box and big-end brasses are machined on a Morton 32-inch draw-cut shaper. The heavy machines are served by electric jib cranes, while work is lifted in and out of the lighter tools by air hoists suspended from runways. The ground floor is lighted by tungsten clusters and heating is by the hot blast system.

An elevator and stairway communicate with the upper floor, which is heated in the same way as the lower floor, but is lighted by Cooper-Hewitt mercury vapor lamps. At the south end of this floor is the bolt department fully equipped for turning out the large numbers of bolts, studs and nuts required on a locomotive. The machine tools in this department include an Acme triple head bolt cutter, 4-spindle Lassiter bolt machine, 6-spindle vertical nut tapper, one $3\frac{1}{4}$ inch and one $2\frac{1}{4}$ inch Gridley automatic, $2\frac{1}{2}$ inch Pratt & Whitney turret lathe, one $2\frac{1}{4}$ inch and two 2-inch Jones & Lamson turret lathes, etc. There is also a 5-inch Alfred Herbert turret lathe on which crank pins are rough turned, to be afterwards ground to finished size on a Landis No. 6 Universal grinder located in the tool room.

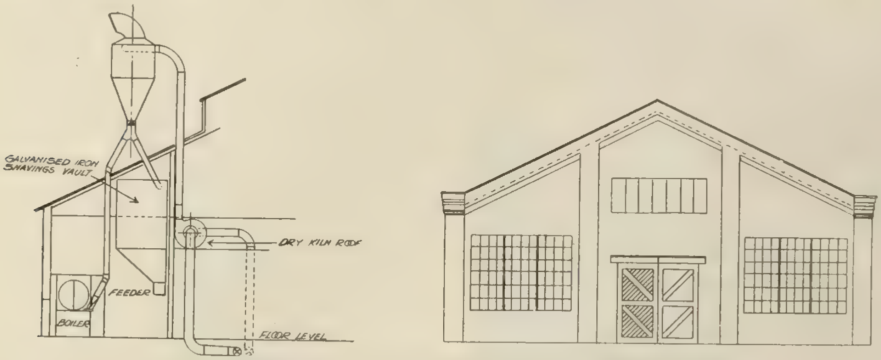
Close by the bolt shop is the die department where all drop forging and bolt forging dies are made. In some shops, this work is handled by the tool room; but here a separate department has been organized. Several die makers are kept employed on this work, as it is seldom an order for locomotives is received by the company that is so small as not to justify drop-forging a large number of parts. The tool equipment in this department consists of No. 3 Pratt & Whitney die sinker, 25-inch LeBlond



CLEANING ROOM SHOWING THE EXHAUST TUMBLING MILLS AND HEATING SYSTEM PIPES.

lathe, 24-inch Gould & Eberhardt heavy duty shaper, 50-inch W.F. & John Barnes drill press, and a Sterling high speed hack saw machine.

Next comes a group of machines for motion work, such as Hammett link grinder, Bridgeport slide bar grinder, Cincinatti double travelling head shaper, etc. Other machines located near the middle of this floor are a metal cutting band saw by Clifton & Waddell, Johnstone, Scotland; No. 4 Cincinnati plain miller; Richards horizontal boring mill; American 6-ft. motor driven radial drill; Newton heavy duty vertical miller; Bullard 42-inch vertical turret lathe, etc.



EAST ELEVATION, CARPENTER AND PATTERN SHOPS.

The tool room is at the north end of this floor and is divided off by the usual screen. It is used to a certain extent for manufacturing purposes as well as for tool making, the crank pins being ground here, as previously mentioned. Brass finishing is also done in this department. The principal machines here are two No. 3 Cincinnati millers, LeBlond tool room lathe, Landis and B. & S. universal grinders, and Gisholt toolgrinder.

Making Milling Cutters.

The method here employed for making the inserted teeth milling cutters used for slabbing and fluting side rods is of interest. The machinery steel blank has the slots milled with one side (that which coincides with the cutting edge of the tooth) truly radial. The other side however, is inclined at an angle of eight degrees in such a way that the slot is wider at the bottom than at the top. The cutters are milled to suit and are given a slight taper in their length to ensure their being a driving fit. Alternate cutters are driven in from opposite sides of the blank, thus locking themselves by the compression of the soft steel between them. This method of manufacture has been found to be entirely satisfactory and is much cheaper than using set screws or keys to secure the cutters. The cutters are found to remain quite tight even after long service.

Iron Rack, Storage Yard, Etc.

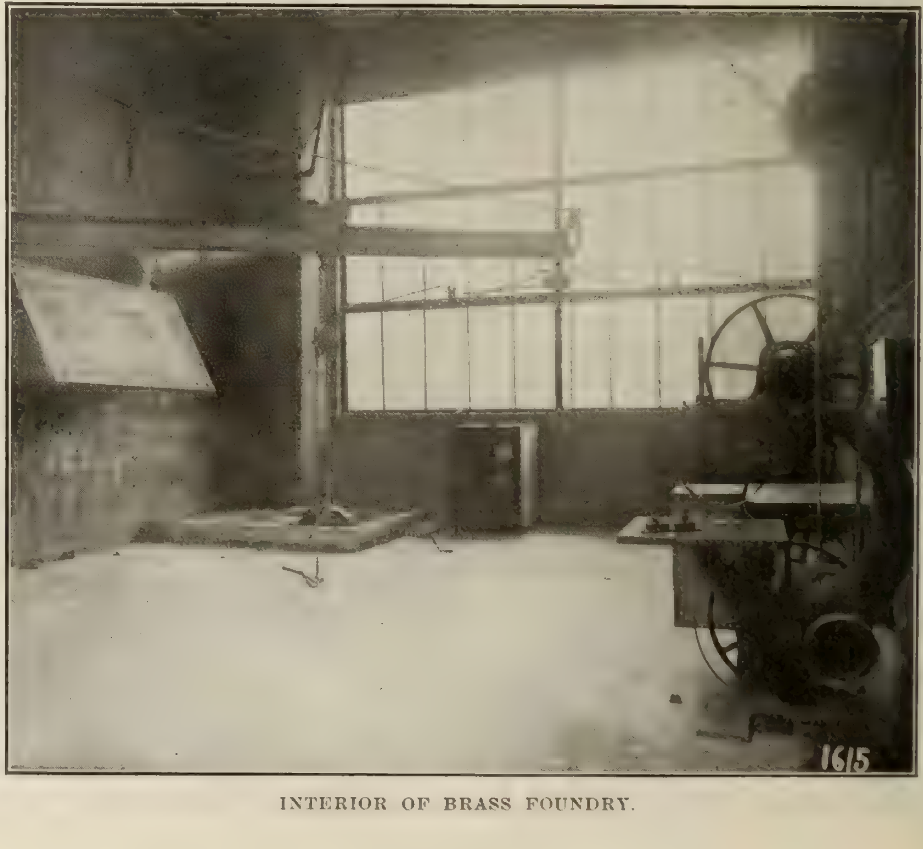
Extending from the south end of the old machine shop to the water front there is a crane runway 234 feet long, served by a 5-ton Northern crane, which is equipped with an Electric Controller & Mfg. Co. magnet. This space forms a storage yard for bar iron, plates, angles, etc. As it lies alongside a slip these materials can be readily brought in by water if desired.

The Power House.

Current for operating these shops is generated in the Company's own power house, erected about eight years ago. It is situated east of the new foundry and is a steel framed building covering an area of 87 ft. by 75 ft., with an annex for the pumps and other auxiliaries. The walls are of reinforced concrete and the flat roof is of hollow tile. A longitudinal fire wall divides the boiler room from the engine room, the former having a width inside of 37 feet 8 inches and the latter 32 feet. Steam at 150 lbs., pressure is raised in six Wicks vertical water tube boilers fitted with Foster superheaters. Four of the boilers are rated at 250 h.p. each, and two at 330 h.p. All are fired by Murphy automatic furnaces in Dutch oven settings. There is a short steel stack 6 feet in diameter through which a draft is induced by a Canadian Buffalo Forge Co. engine driven fan. This installation is in duplicate to avoid breakdowns.

The Dutch oven setting of the furnaces makes the coal handling problem a very simple one. To the south of the power house is an elevated coal bunker, which is filled by a locomotive crane from the yard coal piles or direct from a steamer at the adjacent wharf. An elevated industrial track runs from below this bunker into the boiler house and across the top of the Dutch ovens. Small tip wagons are thus quickly filled up at a chute in the bottom of the coal bunker, run into the boiler house and dumped direct into the furnace hoppers. On their way they pass over a small track scale and are weighed. At present ashes are raked out of the pits by hand and taken away in wheel-barrows; but it is the company's intention to shortly instal an ash disposal system on the suction principle.

The engine room has a dado eight feet high of white tiles, which gives it a very pleasing appearance. It is equipped with a hand operated 5-ton traveller and is lighted by arc and tungsten lamps. There



INTERIOR OF BRASS FOUNDRY.

are three generator units with a total nominal capacity of 750 kilowatts. The engines are all by Belliss & Morcom, and the generators by the Canadian Westinghouse Co. These generate direct current at 250 volts.

Compressed air for the whole plant is supplied by two compressor units. One of these is a Belliss & Morcom vertical cross-compound two-stage compressor with a capacity of 2,000 cubic feet of free air per minute at 100 lbs. pressure when running at 250 r.p.m. The second unit is a Canadian Ingersoll-Rand horizontal cross compound Corliss two-stage compressor 1,250 cubic feet capacity per minute at 100 lbs. pressure, running 96 r.p.m. The exhaust from all five units can be discharged to the atmosphere, to the shop heating system, or to a Worthington barometric condenser. A vacuum of about 27 inches is maintained in the latter by a 6-12-10 Knowles vacuum pump, while the condensing water is raised by a No. 8 single stage turbine pump built by the John McDougall Caledonian Iron Works Co., Ltd., Montreal. This is direct driven by a Robb-Armstrong single cylinder vertical engine.

CROSS SECTION THROUGH FOUNDRY BUILDINGS.

The boiler feed is delivered by two Blake and Buffalo steam pumps, 10-5-10. The water is drawn from Lake Ontario and after passing through a Webster open heater is measured by an automatic recording Venturi meter and is thus checked against the coal, which as previously stated is all weighed. The boiler feed lines are in duplicate, and, as a precaution against the failure of both feed pumps, two No. 9 Korting injectors are always available.

For general water service there is a 10-7-2 steam pump by the Canada Foundry Co.; and the same firm built the two fire pumps, the larger of which is a 20-12-6 and the other a 16-9-12. For handling the returns from the heating system there are two Burnham 10-16-16 vacuum pumps, which deliver to the heater or to sewer as may be desired.

The engine room contains a handsome marble switchboard of ten panels, and each shop has its own feeder line controlled from a separate panel in the switch-board, the whole of the motors throughout the plant operating at 240 volts. To maintain an even voltage in the lighting circuits there is a motor generator balancing set of 10 kilowatt generator capacity.

From the power house a pipe tunnel runs across the site as far as the old machine shop. This accomodates the high and low pressure steam pipes, water service pipes, etc.

Office and Stores Building.

A handsome new stores and office building of four storeys is now nearing completion; and as soon as it and the new erecting shop are ready for use the old office building and erecting shop will be demolished and the new machine shop built on their site. The new office building will accommodate the accounting, time-keeping and mechanical engineers' departments, etc., and will include a drafting office of considerable size. When all the alterations are completed, the Canadian Locomotive Co. will have a compact and, considering the limitations of the site, a very conveniently arranged plant. Except for the pattern and carpenter shop, every building will be in direct communication with all the others, the work converging from all sides upon the erecting shop, where it is finally assembled.

Organization, Etc.

The following is a brief outline of the methods that have been adopted to in-

FOUNDRY LAYOUT.

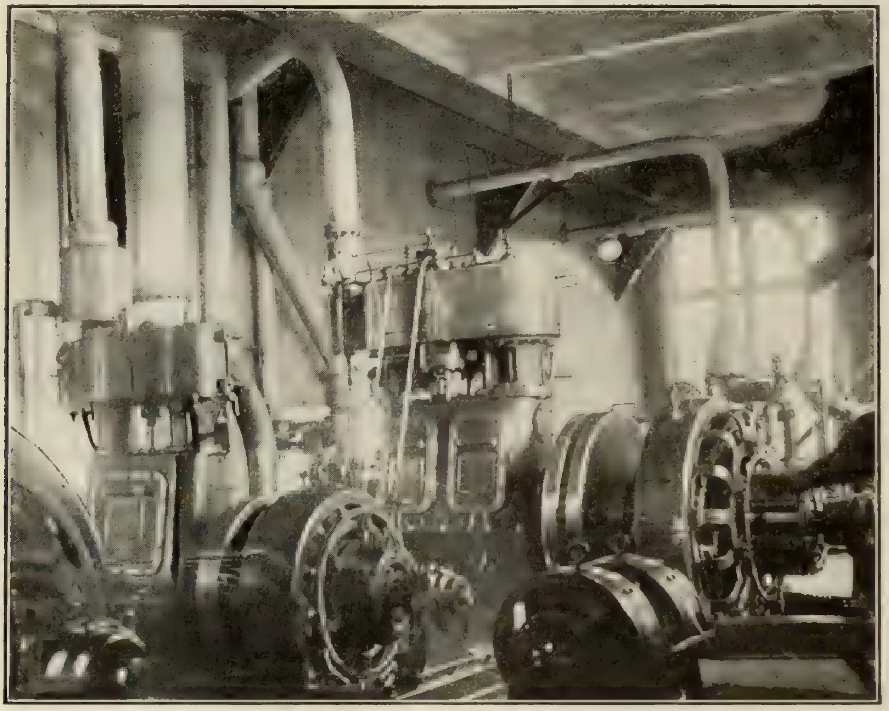
crease output since the reorganization of the new company. This is in addition to the rebuilding of the plant.

Department heads have been selected and the work specialized, so that each one will handle the work for which he is best adapted and with which he is most familiar. Each department head is held directly responsible for the results obtained in his shop, and department heads co-operate with each other for the best interest of the work as a whole. Written suggestions for improvements of any nature are sent into the management and, if approved, are put into effect at once. If not, they are held for future consideration.

Old and badly worn machines have been replaced by new tools of the latest type. The machinery has also been largely rearranged and strengthened to operate more efficiently. Jigs, special tools and equipment have been purchased or manufactured; and methods have been changed with a view to producing the work in the most up-to-date manner.

Date schedules have been made and placed in the hands of all concerned, showing when it is necessary that work be finished in each department in order to maintain the output. A system of "Delay Reports" has been established, whereby any department failing to keep up with the schedule requirements is brought to the attention of the management, who give it special attention and assistance as may be necessary. These schedules cover all departments. In order to get engines out on a certain date, it is necessary to start making drawings and patterns, ordering material, etc., some time in advance; and failure in any of these details necessarily means delay in output. On the other hand, the completion of work in each department according to schedule dates means a continuous and steady output, and avoids the otherwise unavoidable "breaks" between orders.

An inter-departmental delay report is in use by means of which any department may ask for work, even though ahead of the schedule, in order to keep men and machines steadily employed. "Move Orders" are used for the delivery and receipt of material between the material stores and shops. This "move order" is also used in some cases for moving material from one shop to another, receipt for delivery being taken thereon. These "move orders" are anticipated as far as possible in order to avoid congestion in the Material Department.



INTERIOR OF POWER HOUSE, SHOWING ENGINES AND GENERATORS.

Piece work has been established in nearly all departments. Prices are based on actual conditions under which the work is performed, these having been ascertained from time studies and other records. It has been the company's policy to secure the best men and pay them the highest wages. Good tools and conditions are maintained, and much attention has been given to dealing fairly and honestly with the employes and to avoiding the usual "red tape" which tends to cause so much discord and dissatisfaction.

A system of timekeeping and accounting has been installed, whereby accurate records of costs are obtained. These records are furnished to department heads, all of whom co-operate to eliminate waste and unnecessary expenditure. Allowances are allotted to each department and an effort is made by each department head to keep within the allowance as far as is consistent with the best interests of the work. Necessary records are given to each foreman to enable them to handle their work to the best advantage.

Throughout the plant the conditions under which the men work have been greatly improved. Sanitary drinking fountains and steel lockers for clothing and tools have been placed in each shop. Good wash rooms and toilets are being placed in all the new buildings and are kept clean and sanitary at all times. Machine gears and other dangerous places are carefully guarded, and first aid treatment is promptly given to any injuries that may occur. In fact the company has made the conditions under which the men work as pleasant as possible in an earnest effort to have its employes satisfied and contented.

THE ROELOFSON ELEVATOR CO.

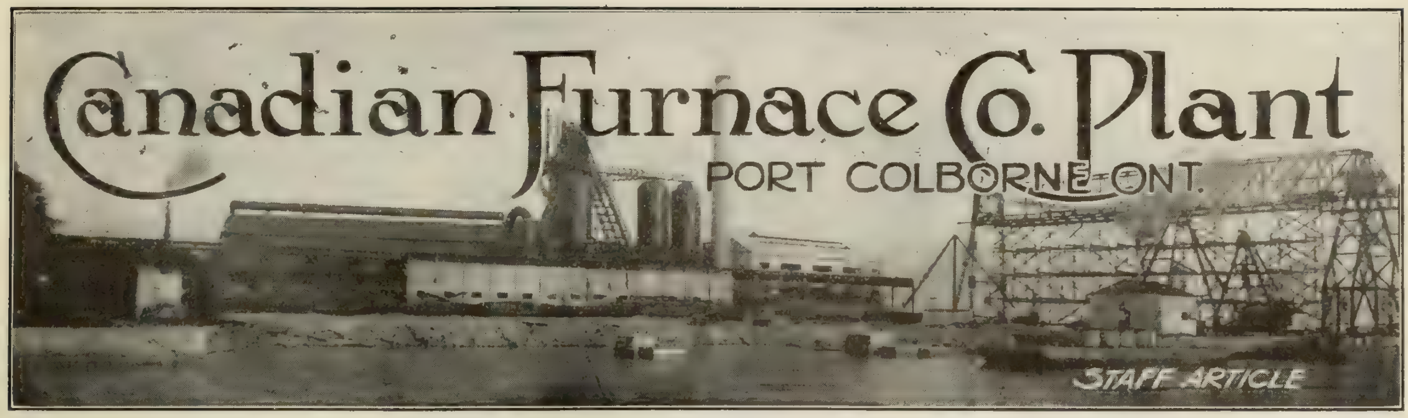
ONE of the more recent concerns established at Galt, Ont., is the Roelofson Elevator Co., who started operations there in February, 1911. This firm manufactures a complete line of passenger and freight electric elevators, worm gears, controllers, etc. The site covers 3½ acres and is connected with the Galt, Preston and Hespeler Railway.

The main building is 204x66 ft. 8 ins., of brick construction, with concrete floors. At one end are the offices and a general store room and at the east end a carpenters' shop and blacksmiths' shop. The building is equipped with the latest machinery for this class of work and the most modern methods are used in the construction of the product. J. Frank Roelofson is the manager of the company.

GUELPH STOVE CO., LTD.

AN old established Guelph, Ont., concern, the Guelph Stove Co., Ltd., have built a new plant in the eastern section of that city. The site covers about 4½ acres and the buildings cover an area of 57,619 sq. ft. The buildings are of brick construction and were designed by W. A. Mahoney, architect, Guelph. They cost $40,000 and comprise a foundry, pattern shop, boiler, milling, nickeling, assembling and packing rooms, warehouse and office.

The product of the company is stoves, and manufacturing was commenced early in 1912. The company is financed entirely by local capital.



Canadian Furnace Co. Plant

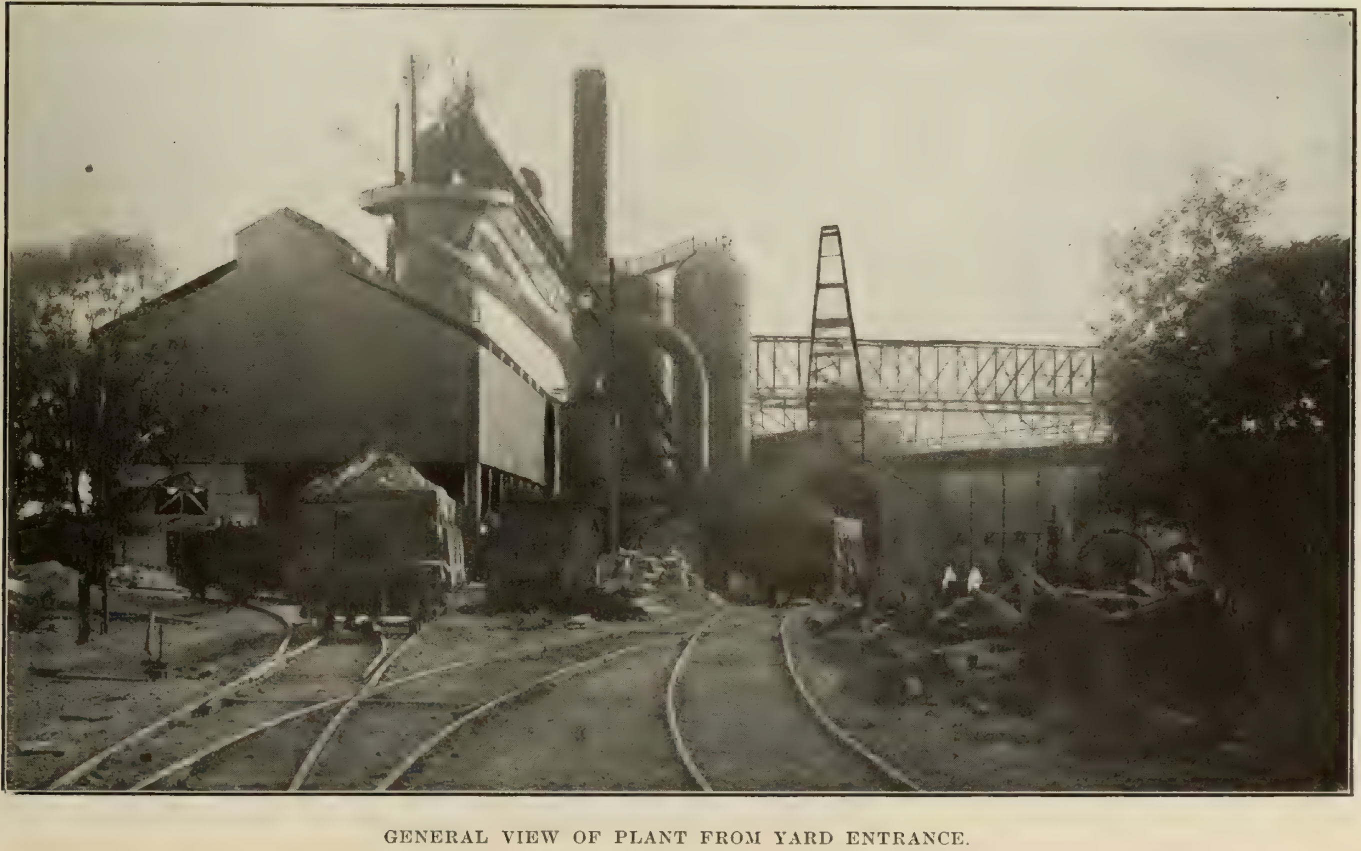
PORT COLBORNE-ONT.

From the standpoint of industrial enterprise with its necessary accompaniment of confidence in the future greatness of this Dominion as a commercial nation, the completion and subsequent successful operation of the Canadian Furnace Co. plant at Port Colborne ranks as one of the most important manufacturing developments of the year 1913.

THE Canadian Furnace Co. recently started operations at their new plant, Port Colborne, Ont., for the manufacture of pig iron. The furnace was successfully blown-in on September 27, and on the following day a heat was drawn. The site of the plant is called Victoria. It is situated at the junction of the Welland Canal and Lake Erie, with a frontage of 2,200 ft. to the canal, 660 ft. of which is already docked; the remainder to be converted into dockage as fast as improvements can be carried out. Where the furnace now stands was originally under water to a depth of 5 ft. The bottom, however, is rock, upon which the foundations were laid by means of cofferdams.

The company have at present 12 acres under development but they have altogether a property covering 50 acres, a large portion of which is still under water, leased from the Government for a period of 63 years. At the dock there is a depth of 25 ft. of water, but the layout provides for a depth of 30 ft. at a future date. The largest lake boats are able to discharge their cargoes of raw material at the dock. These latter consist of ore from Lake Superior points and from the Belmont mine at Cordova Mines, Ont., owned by the company. Limestone is shipped from Calcite, Mich., and coke from the Connellsville region in Pennsylvania. The location of the furnace is exceptionally good, being as already stated on the canal and therefore on the highway between the Great Lakes and eastern points; thereby affording a good centre for the distribution of the product as well as being favorably situated for obtaining raw materials.

All the stock of the company is owned by the Buffalo Union Furnace Co., Buffalo, N.Y., and the furnace is being operated by them to supply the Canadian market. The plant was designed by the company's engineer, and the contracts



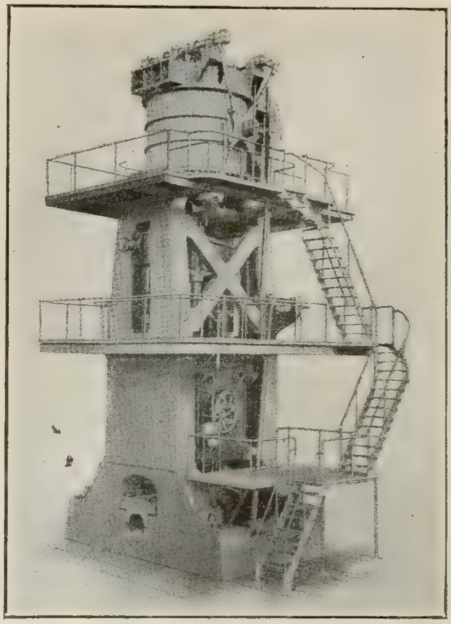
GENERAL VIEW OF PLANT FROM YARD ENTRANCE.

for construction and supply of equipment were let individually. The foundations were built by the Monarch Engineering Co., Buffalo; the bricklaying contract was carried out by the A. E. Anderson Co. Buffalo; the firebrick for the furnace, stoves etc., was supplied by the Harbison-Walker Refractories Co., Pittsburgh, the Stowe, Fuller Co., Cleveland, and the General Refractories Co. The steel work for the buildings was supplied and erected by the Canada Foundry Co., Toronto.

It will be observed from the general plan, and from the description to follow, that the handling of materials has been reduced to a minimum with a consequent reduction in operating expenses which is in itself an important feature. The industrial track system is standard gauge, and is connected with the Grand Trunk Railway. The company operates the system with their own locomotives. Under normal conditions about 150 men are employed in the operation of the present furnace, which has a capacity of 325 tons per day. Provision has been made, however, for the building of another furnace on the lake side of the present furnace.

Ore Dock and Bridge.

The ore dock has at present a frontage of 600 ft. on the canal and has a width, for storage purposes, of 235 ft. It will be possible to store about 250,000 tons of ore and 100,000 tons of limestone for use during the period when navigation is closed. Tracks are laid the full length of the ore dock or storage yard. and on each side for the ore bridge which carries the raw materials from the ships at the dock to the storage bin system or to the yard according to requirements.



SINGLE UNIT, VERTICAL LONG CROSS-HEAD BLOWING ENGINE.

The ore bridge is a substantial steel structure and was supplied and erected by the McMyler Interstate Co., Cleveland, O. It has a main span the full width of the storage yard viz. 35 ft., and in addition, has at the canal end a swinging apron 50 feet long, and at the shore end over the bin system tracks, a cantilever span of 40 feet. The bridge is 80 feet high from the dock level to its underside. It is electrically operated, and is equipped with a 3 cub. yd. bucket. Another ore bridge of the same size and capacity is now being constructed.

When in operation, the ore or stone, as the case may be, is carried from the ship at the dock along the ore bridge and dumped into the transfer car which runs on tracks laid over the storage bin system, the car being stationed under the cantilever arm to receive the contents of the bucket. The transfer car has a capacity of 30 tons, is electrically operated and was supplied by the Brown Hoisting Machinery Co., Cleveland, Ohio. When full, the car travels along and deposits the ore into the bins underneath according to the grade of ore being handled. The incline trestle approach from the railway tracks to the top of the bin system is 850 feet long and 30 feet

SHOWING INTERIOR OF CAST HOUSE.

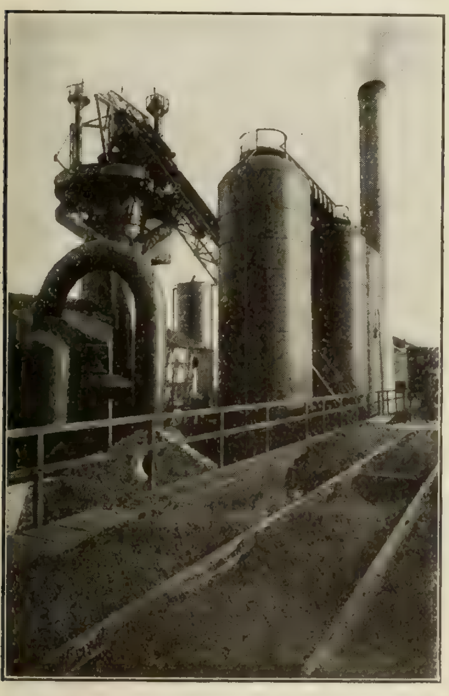
high at the bins, and was built by the Lackawanna Steel Co.

The coke is received in cars over the trestle and is dumped directly from each car into the coke bins, which are those adjacent to the skip bridge. As indicated in the general plan, coke is drawn directly from the bins to the skip cars.

The ore was brought to the bins in cars before the bridge was completed.

Storage Bin System.

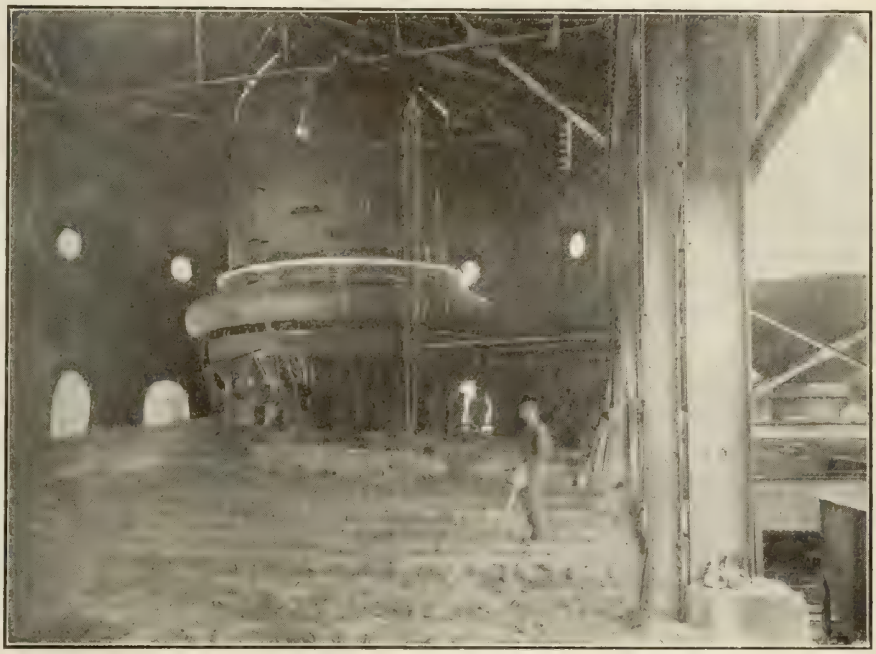
The bin system is parallel to the storage yard and was installed by the Canada Foundry Co. There are 6 ore bins with a total capacity of 1,800 tons, 2 limestone bins with a total capacity of 500 tons, and 2 bins capable of storing 600 tons of coke. The bins are bricked in, and a steam heating system is installed to prevent freezing in severe weather. Under the bin system is the stock house which is equipped with tracks for operating the scale car. The latter has a capacity of 10 tons, is electrically operated and was supplied by the Brown Hoisting Co. The car transfers the materials from the bins to the skips at the bottom of the skip hoist. An interesting feature about this car is that it is equipped with a series of scales which are set to register the amount taken from each bin, and in the desired proportions according to the quality of pig iron that is ultimately required. The underside of each bin has a hopper door which is under the control of the operator of the scale car.



STOVES AND FURNACE TOP FROM BINS.

Skip Hoist.

The steel skip bridge which is shown on the cross section is double track, there being two skip cars, one ascending as the other descends. From the skip car, material is dumped into the receiving hopper on top of the furnace.

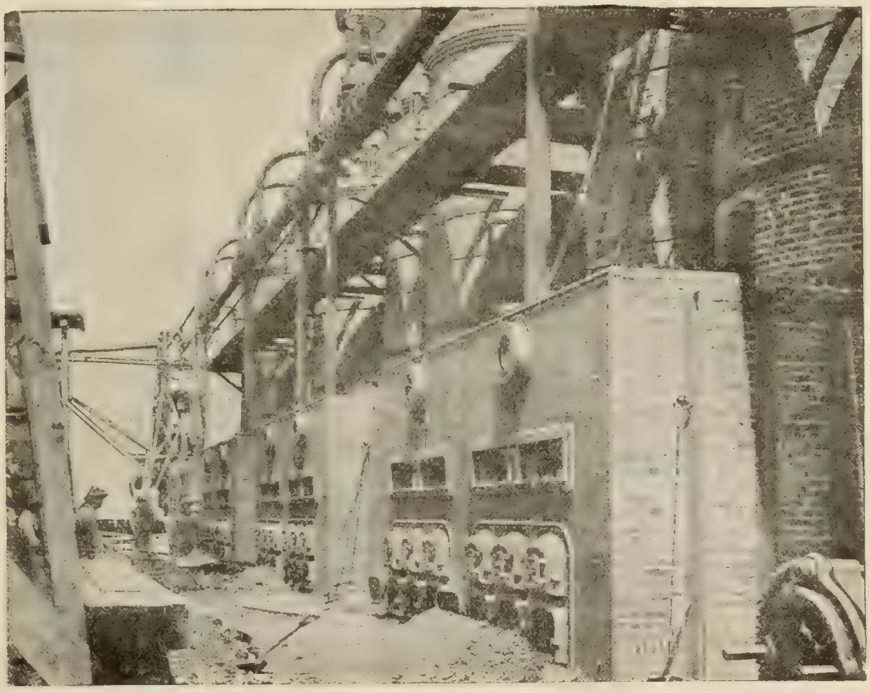


SHOWING LOWER PART OF FURNACE IN CAST HOUSE.

The skip hoist is of the McKee type and the two skip cars transfer the materials from the scale car to the top of the furnace. The Variety Iron & Steel Co., Cleveland, Ohio, supplied and erected this equipment.

The skip cars are operated by an Otis reversible steam hoisting engine located in an engine house under the hoist. The engine has two 14 in. diameter cylinders by 14 in. stroke, the winding drum being 6 ft. diameter and 8 ft. long. The charge for the furnace consists of 2 skips of ore, one of stone and two of coke, which is equivalent to 13,600 lbs. of ore, 3,400 lbs. of stone and 6,500 lbs. of coke, the proportion varying according to the quality of pig iron required.

The skip car is mounted on a frame with three sets of wheels, the frame being hinged on the middle axle. The car itself is attached to this frame between the top and central axles and the hoist cable is attached at the bottom axle. The middle pair of wheels have double flanges. All three sets of wheels travel up the incline on the main rails, the middle pair bearing on the inside flanges. As the car approaches the



BOILER BATTERY PREVIOUS TO ERECTION OF BOILER HOUSE.

top of the furnace, the main rails are bent over towards the centre of the furnace. The front wheels follow these rails and the centre wheels transfer onto another rail, which catches the outside flanges, and carries them on up the incline, thus dumping the bucket.

Furnace.

The furnace is located at the lake end of the cast house and was built by the Variety Iron & Steel Co. It is 80 ft. high, 13 ft. 6 in. in diameter at the hearth, 19 ft. 6 in. diameter at the bosh, and 13 ft. 6 in. diameter at the stock line. There are 10 tuyeres through which air is blown at 15 lbs. pressure. The bosh and hearth are fitted with 119 cooling plates made of bronze and supplied by the Tallman Brass & Metal Co., Hamilton, Ont. These plates have a water cooling system, water being supplied through a series of pipes connected to a manifold which encircles the furnace.

The top charging apparatus on furnace top is manufactured under the A. G. McKee patent, the distinguishing feature being the receiving hopper. It is conical in form and rests on ball bearings supported on top of the gas seal.

Through suitable gearing the receiving hopper can be rotated by motor on the furnace structure, as indicated on the drawing. The receiving hopper is closed at the bottom of the small bell. In operation when the skip load of material is dumped into the receiving hopper and while the empty skip car is going back down the incline, an electrical switch which controls the furnace top motor is thrown and the receiving hopper is rotated a predetermined portion of a circle The small bell is then lowered allowing the contents of the receiving hopper to drop on the large bell. The small bell is next closed and the receiving hopper is ready to receive another skip load. After the various materials that form one charge have been deposited on the large bell, the latter is lowered, feeding all the material into the furnace. By this rotation of the receiving hopper to different points the material is distributed uniformly around the large bell, giving a uniform density to the material discharged into the furnace. The bells are operated by electric motors controlled from switches located in a house near the foot of the skip hoist.

GROUND PLAN SHOWING LOCATION OF THE VARIOUS DEPARTMENTS.

The cinder notch is located at the side of the furnace, where the slag is drawn off into a ladle running on tracks outside the cast house. The ladle has a capacity of 15 tons and was supplied by the Wener Machine Works, Lebanon, Pa. The iron notch is in front of the furnace, and is equipped with a McCarthy steam operated mud gun for plugging the hole after the metal has been drawn off. The metal is skimmed while it is being tapped. Near the furnace is an office where are installed two pyrometers supplied by the Uehling Instrument Co., Buffalo. One of these pyrometers indicates the temperatures of the blast and the gas at the top of the furnace, while the other records the temperatures of the gases and blast and also the pressure of the blast.

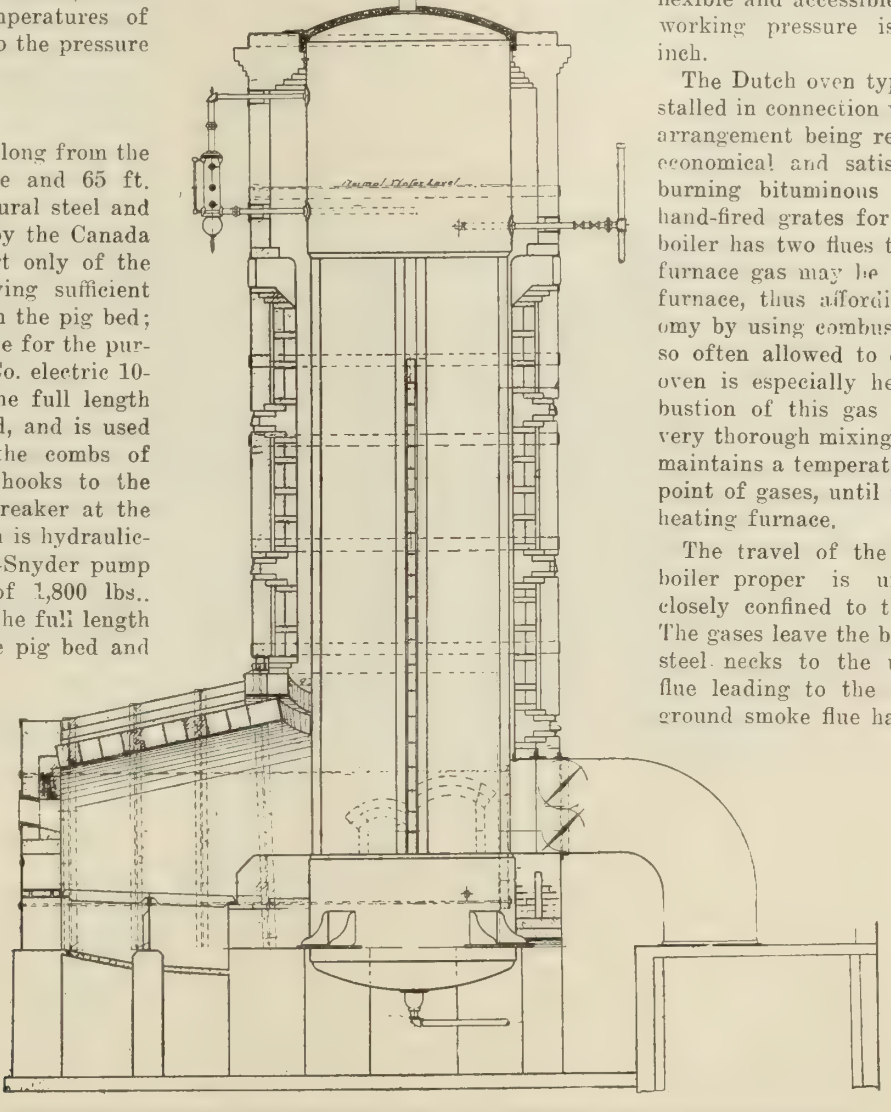
Cast House.

The cast house is 200 ft. long from the centre line of the furnace and 65 ft. wide. It is built of structural steel and was supplied and erected by the Canada Foundry Co. The top part only of the sides is covered in, allowing sufficient space for loading cars from the pig bed; tracks running along outside for the purpose. A Brown Hoisting Co. electric 10-ton crane operates over the full length and breadth of the pig bed, and is used principally for carrying the combs of metal, by means of bed hooks to the Brown Hoisting Co. pig breaker at the end of the cast house which is hydraulically operated by a Wilson-Snyder pump working under pressure of 1,800 lbs., Overhead runways extend the full length and over both sides of the pig bed and are equipped with McMyler chain blocks for handling the pattern used for making the pig moulds. Outside the cast house is a pit 20 ft. diam. by 20 ft. deep for granulating the slag.

It is the intention of the company to install a pig casting machine which will enable them to supply chill cast basic iron. By this means the iron is tapped from the furnace into a large ladle where it becomes thoroughly mixed. From this ladle it is poured into iron moulds which are carried on an endless belt. The arrangement avoids contact with the sand and secures perfect uniformity of composition.

Stoves.

For heating the furnace blast, three stoves have been installed by the Variety Iron & Steel Co. They are of the up-blast vertical type, made of steel plate and lined with fire brick, 250,000 bricks being required for each stove. The stoves are located near the furnace, are 85 ft. high and 20 ft. diameter inside, and have a connecting platform on the top. They are arranged so as to work in series. While two are being heated by the waste furnace gases, the third, having previously been heated, is warming the air which is passing through from the blowing engines to the tuyeres. The furnace gases pass through the 6 ft. diameter downcomer which connects the furnace top with the stoves and is equipped at the top with two bleeders which are set to go off automatically when the pressure rises above a certain point. In the downcomer is installed a gravity type dust catcher which is set above the tracks, allowing the cars to go under and carry away the dust when necessary.



SECTION THROUGH BOILER SETTING AS ARRANGED FOR UTILIZATION OF WASTE HEAT.

Boilers.

The boiler house is 120 ft. long by 35 ft. wide and is of steel and brick construction, the steel work being supplied by the Canada Foundry Co. The boilers are of the vertical water tube type, manufactured and installed by the Wickes Boiler Co., Saginaw, Michigan. The 8 units chosen are of 300 horse-power each, two in a battery; making a total of 2,400 horse-power, thus a very flexible and accessible plant. The boiler working pressure is 150 lbs. per sq. inch.

The Dutch oven type of furnace is installed in connection with the boilers, the arrangement being recognized as a most economical and satisfactory method of burning bituminous coal. Besides the hand-fired grates for burning coal, each boiler has two flues through which blast furnace gas may be introduced into the furnace, thus affording a further economy by using combustible gases that are so often allowed to escape. The Dutch oven is especially helpful for the combustion of this gas as it permits of a very thorough mixing of air and gas, and maintains a temperature close to ignition point of gases, until the latter reach the heating furnace.

The travel of the gases through the boiler proper is unusually long and closely confined to the heating surface. The gases leave the boilers through short steel necks to the underground smoke flue leading to the stack. The underground smoke flue has the advantage of not interfering with the cleaning of the soot from the heating surface. Soot cleaning doors are located at convenient points in the setting. These doors are reached by the aid of platforms to facilitate blowing the soot off the heating surface. There are two manholes in the upper and lower drums to allow for close inspection of the interior. All the steam piping was furnished by the Best Mfg. Co., Pittsburgh, the main steam line being 14 in. diameter with 6 in. diameter leads to the boilers. Between the boiler house and stoves is a brick stack, 150 ft. high and 10 ft. diameter inside, built by the Heine Chimney Co., Chicago.

Power House.

The power house is of substantial brick construction and is 80 ft. long by 60 ft. wide, inclusive of the pump pit. It contains the blowing engines, the electric power generating sets, pumps, etc. The blowing engines, supplied by the Allis-Chalmers Co., Milwaukee, Wis., are of the compound long crosshead vertica type, with the air cylinders located above the steam cylinders. The H.P. steam cylinder is 48 in. diameter and the L.P. 84 ins. diameter, while the air cylinders are 84 ins. diameter on both sides. The stroke is 66 ins. Corliss valves are fitted to the steam cylinders. The guaranteed capacity of the blowing engines is 380 cu. ft. of air per revolution when running at 55 r.p.m. against a pressure of 30 lbs. per sq. in. The normal speed, however, is about 40 r.p.m., and pressure 15 pounds. The engines are of the same type and make as others installed at the Buffalo plant where they have given very satisfactory service.

An interesting feature regarding these blowers is that they can be operated independently or as a compound unit by a suitable arrangement of the steam and exhaust piping. The H. P. side can be operated as a simple blower taking steam at boiler pressure. Likewise, the L.P. side can be run independently although in this case a reducing valve would have to be used to reduce the boiler pressure to what would be the receiver pressure when the engines were running compound.

The company generate their own power, and for this purpose have installed two Curtis impulse type steam turbines which are direct-connected to 300 K.W. D.C. generators 125-250 volt, three wire, and run at 1800 r.p.m. These sets were supplied by the Canadian General Electric Co. The six panel switchboard is equipped with the usual instruments and was supplied by the Canadian

GENERAL ARRANGEMENT OF FURNACE, SKIP BRIDGE AND BIN SYSTEM.

General Electric Co. A 10-ton overhead hand travelling crane, built by the Euclid Crane Co., Cleveland, Ohio, serves the power house.

On one side of the power house is the pump pit, containing the pumps, condensers, etc. The condenser was supplied by the Deane Steam Pump Co., Holyoke, Mass., who also supplied a duplex type condenser pump, 20-26--24 in. A Cochrane heater provides feed water at 130 degrees Fah. The heater was supplied by the Canadian Allis-Chalmers Co., and in connection with it are two Worthington 12-17-12 in. boiler feed pumps, duplex type. The stand pipe is fed with water from the lake and for this purpose two Worthington 16-18-18 in. duplex steam pumps have been installed. The stand pipe located between the power house and the furnace is of steel construction, 18 ft. diameter and 65 ft. high, and was supplied and erected by the Canadian Allis-Chalmers Co.

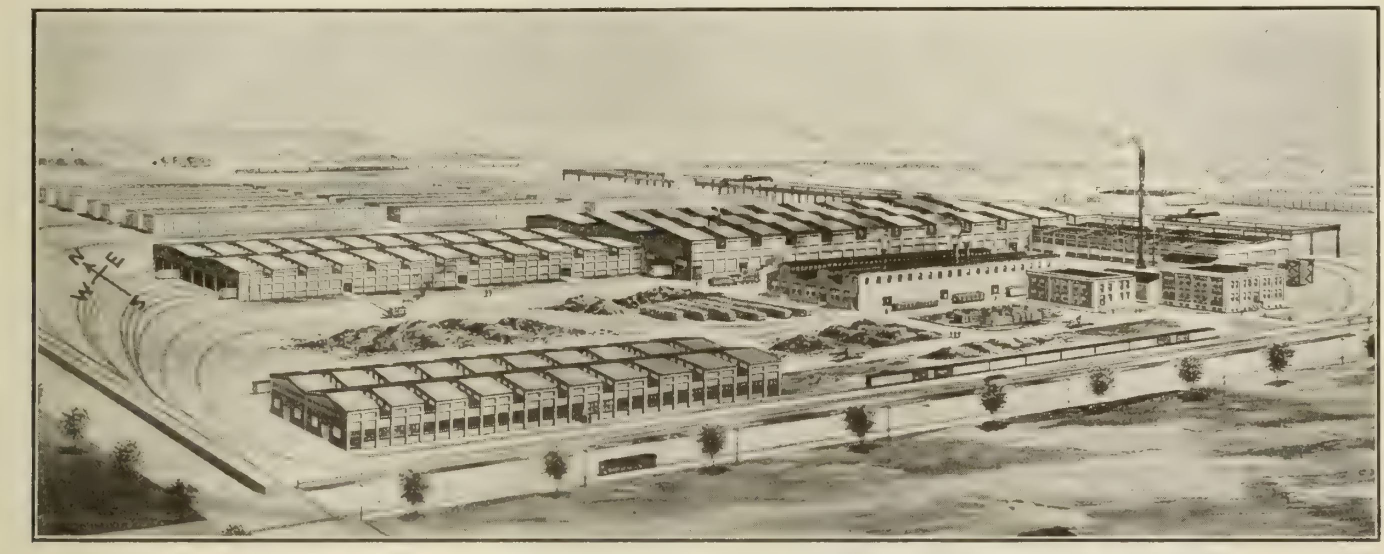
General Features.

The blacksmiths' shop is located near the stoves and is being equipped with the usual tools, fires, etc. A machine shop is contemplated and will be built near the stock house. The yard locomotives were supplied by the Baldwin Locomotive Co., Philadelphia, and the American Locomotive Co., Schenectady, N.Y.

The plant is under the supervision of Mr. B. Marron, the general manager, who also holds a like position at the Buffalo plant. Mr. Marron has been with the company 12 years, being previously with the Illinois Steel Co. The other officers of the company are Frank. B. Baird, president; Harry Yates, 1st vice-president; C. C. Collins, 2nd vice-president; R. F. Schelling, secretary; M. A. Hanna & Co., Cleveland, Ohio, are the exclusive sales agents for the product of the furnace.

NEW CAR SHOPS AT FORT WILLIAM.

THE new plant of Canadian Car & Foundry Co., Ltd., at Fort William Ont., is rapidly approaching completion and is one of the most important industries now located in that thriving city. Work was only really started on the plant in October, 1912, although the ceremonial turning of the first sod took place sometime previous to that date. The various buildings are now all erected and covered in, and the bulk of the equipment is installed.



CANADIAN CAR & FOUNDRY CO. PLANT AT FORT WILLIAM, AS IT WILL APPEAR WHEN COMPLETED.

The plant stands on a site of 84 acres at the west end of the city, near the Canada Iron Corporation foundries and the new nail and spike mill of the Steel Company of Canada. The site has a frontage of about 400 feet along the Kaministiquia River, with a wharf 270 feet long, enabling raw material to be brought in entirely by water. A portal crane by the Brown Hoisting Machinery Co., runs along the wharf and transfers material from the steamers to cars. The crane is equipped with a generator and lifting magnet for handling pig iron.

The main shop runs east and west and is 900 feet long by 240 feet wide. This space is divided up into six departments, viz.:—Planing mill, 500 ft. x 80 ft., steel fabrication, 500 ft. x 80 ft.; bolster shop, 260 ft. x 80 ft.; truck shop, 240 ft. x 80 ft.; forge shop, 400 ft. x 80 ft.; steel car erection shop, 400 ft. x 80 ft. and wood car erection shop, 400 ft. x 80 ft. At the west end of the two last named departments are the steel car and wood car paint shops, each 700 ft. x 80 ft. At the east end of the main shop, and at right angles to it, is a stock yard served by a 10-ton crane of 80 ft. span on a runway 1,020 feet long. It will thus be seen that raw material moves in a continuous line from stock yard to erection shop and thence to the paint shop, the finished cars emerging from the west end of the latter. All these buildings are heated by four batteries of steam coils arranged along the north side of the shops. These coils take exhaust steam from the air compressors in the power house, live steam being used when the compressors are idle. Air is drawn through the coils by a hot blast fan and conveyed by underground ducts to openings at the bottom of the shop columns. The whole of the heating apparatus is placed underground for the sake of economizing space. When the plant is enlarged, the extensions will be made in a northerly direction, but the present heating units will remain where they are and will then be in the middle of the shops.

The machine shop and power house are adjacent to one another and lie at right angles to the south-east side of the main shop. The power house is of special interest. It covers an area of 175 ft. x 110 ft. with allowance for future extensions to the south. All machinery throughout the plant is electrically driven, 3-phase alternating current at 550 volts, 60 cycles, being generated by three Allis-Chalmers generators, each of a nominal capacity of 600 k.w. Each generator is built for a 25 per cent. overload and is direct connected to a producer gas engine by the Mesta Machine Co. There are four double sets of gas producers installed by R. D. Wood & Co., Philadelphia, each being capable of gasifying 1,800 pounds of bituminous coal per hour, the coal all being handled mechanically. The gas producers make water-gas or ordinary producer (blow-up) gas as required. The blow-up gas has a heating value of about 110 B.T.U. per cubic foot, and the water gas of 300 B.T.U., the richer gas being employed for heating the furnaces in the forge shop and elsewhere, while the blow-up gas is used in the gas engines. Water gas is becoming increasingly popular for furnace heating on account of the advancing cost of fuel oil. In the process of making water gas the poorer blow-up gas is necessarily formed, and in many plants is allowed to go to waste, whereas it might be usefully employed for producing power, as is done here.

Further equipment in the power house includes an exciter set of 250 k.w., consisting of a Canadian General Electric generator direct connected to a Robb-Armstrong vertical high speed engine. Four Robb-Mumford water tube boilers of 250 h.p. each have been installed. These will be fired by scrap wood from the planing mill and will supply steam to two Canadian Ingersoll-Rand two-stage cross-compound air compressors of 3,000 cubic feet capacity at 100 lbs. pressure. The switchboard is by the Canadian General Electric Co. and contains twenty-six marble panels. There is independent control of both lighting and power in each department.

WHARF ON KAMINISTIQUIA RIVER—CANADIAN CAR & FOUNDRY CO. NEW CAR PLANT AT FORT WILLIAM, ONT.

Material being handled by a Portal Crane equipped with Electro Magnet.

The power house and machine shop being in line, one overhead traveller serves both departments. There are eleven overhead cranes throughout the plant, all of 10 tons capacity and all built by the Dominion Bridge Company, Montreal. All parts of these cranes are accurately interchangeable.

Parallel with the main shop is the foundry building, now rapidly nearing completion. The grey iron foundry is 160 feet in length and the wheel foundry 220 feet, the width of both being 145 feet. The daily output of the grey iron foundry will be 30 tons and of the wheel foundry 350 wheels.

The arrangement of the various departments and machines in the main shop has been very carefully thought out with a view to saving all lost motion in moving material through the shop. Thus, the air dried lumber piles are to the north of the shop, the lumber entering the planing mill through a 60-ft. opening at the east end of the north wall. The lumber then passes down a line of borers, mortisers, etc., arranged along the north side of shop, and thence to the wood car erection department. The lumber to be kiln-dried is stored at the east end of the site and after removal from the kilns enters the planing mill at the east end. It then passes along a line of machines on the south side of the mill.

Owing to the present temporary lull in business the completion of this plant is not being rushed; but when it goes into full operation, as it is hoped it will do next spring, the output will be 30 cars per day.

❖

CANADIAN LOCOMOTIVE CO.

THE Canadian Locomotive Co., Kingston, Ont., has been coming along very nicely during the year, even under the less active industrial conditions, and it is understood that at the present time there are contracts on the books sufficient to carry the plant through in full operation until about March 15th.

WINDSOR, ONT., FACTORY DISTRICT.

SATISFACTORY progress has been made during the year in the Windsor, Ont., factory district. In addition to the plants already established, there are several other concerns who have already commenced building operations, or are about to do so in the near future.

The city has appropriated a large tract of land on the south side of the municipality, and formed two factory districts, one comprising an area of 40 acres, which is practically all taken up, and another which covers an area of 23 acres.

In the No. 1 factory district the Swedish Crucible Steel Co. of Detroit have already started work on the foundations for a plant for the manufacture of steel castings for automobile parts, agricultural implements, springs and drop forgings, etc. Four acres have been purchased and two storey buildings will be erected and equipped with modern machinery. The capital of the Company is $100,000, and it is estimated that 100 men will be employed. In the same district the Detroit Steel Products Co. and the Vincent Steel Process Co. have purchased sites, and it is expected that work will be commenced on the foundations in the spring.

In the No. 2 factory district three acres have been sold to the Ontario Steel Products Co. This concern have plants in other parts of Canada, but are going to build a factory at Windsor for the manufacture of spring-making machinery and special machine tools for making dies for this purpose. The initial building will be 175 x 60 ft., and provision will be made for extensions without interfering with the plant operation. It is proposed to instal a power plant for using natural gas. The Windsor factory will be a branch of the Dowsley Spring and Axle Co., Chatham, which is owned by that Company.

Another Company who are proposing to locate in this district is the Windsor Power Building Co., Ltd. It is the intention of this Company to build a modern reinforced concrete, fireproof factory building, five storeys high, and having a total floor space of 50,000 sq. ft. The building will be let for manufacturing purposes, and being located near the Essex Terminal Railway, good facilities will be provided for shipping. The Company is capitalized at $150,000, and the representatives in Windsor are E. T. Post and W. W. Smales, both of Staunton, Va.

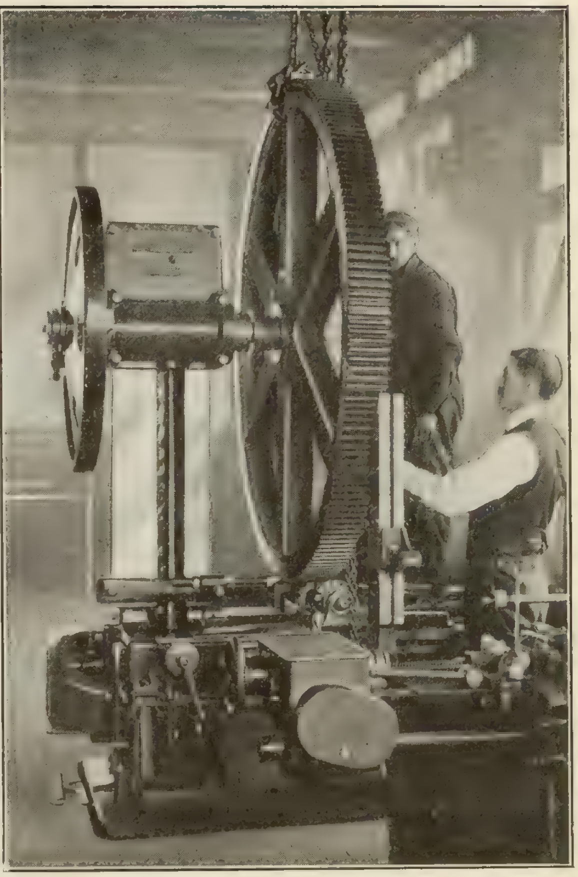
Mr. C. F. Barker, the Industrial Commissioner of Windsor, reports a number of inquiries for factory sites. The advantages of Windsor as a manufacturing centre are becoming widely known, its location being one of the principal reasons.

Plant of the Hamilton Gear & Machine Co.

TORONTO, ONT.

- STAFF ARTICLE -

A new and up-to-date plant, the principal product of which is cut gears. Some interesting features of factory building design and of machine drives. Departments and equipment placed in convenient relative positions. Description of machine tool equipment. Planing bevel gears. The hardening room a leading feature.



THE Hamilton Gear & Machine Co., Toronto, Ont., claim to be the only real gear shop in Canada, and the plant, which was recently inspected by a representative of Canadian Machinery, is substantial evidence to that effect.

The business was started two and a half years ago by Chester B. Hamilton, Jr., B.A.Sc., graduate in Mechanical Engineering of the University of Toronto, who has had quite a varied engineering experience, considering his years.

Building Features.

The plant is housed in a heavy reinforced concrete building designed especially for the nature of the work to be done. While the good qualities of this material as regards low depreciation and freedom from fire risk are generally conceded, there is a more important point sometimes overlooked—that of its almost ideal adaptability to special requirements of design. For example, in this plant the heavy longitudinal beams at the sides of the building extend above the second floor or roof as a parapet, their bottom edge being level with the bottom of the secondary cross beams. Thus, over two feet of additional window height is obtained, which is very desirable in a wide shop. Another interesting point is the method of supporting the steel crane girders. These are carried on heavily reinforced brackets moulded integrally with the columns. The supposed difficulty of attaching minor fittings to concrete, which is often considered a disadvantage in this type of structure did not prove serious. A. H. Harkness, Consulting Engineer, Toronto, was the designer of the building proper, while the plant was laid out by Mr. Hamilton.

The building is on a corner, with entrances on three sides and light and ventilation on all four. It is divided into three bays with office and store room across the north end. The centre and west bays contain the machine shop, and each bay is served by a 2-ton overhead travelling crane, running the full length of the shop.

Drives for Machines.

Most of the machines are either driven by individual motors or belted directly to Dodge clutch pulleys on the line shaft. This dispenses with counter shafts and two-thirds of the belting which would otherwise be required and leaves the shop clear for efficient crane service. The motors and machines are so located that all the main drives are tight on the under side of the belt and run very slack.

The method of carrying a line shaft from the crane girders is shown in Fig. 2, which also indicates how the crane is arranged for maximum headroom. The electric conduits are carried partly along the crane girders and partly under the floor, with outlets at each column.

Departmental Layout.

The third or east bay contains the pattern shop tool room, heating apparatus and the hardening room. The building is heated by hot air with fan, using elevated steam coils. These with the fan are carried in a structural steel frame close to the ceiling, with the double advantage of saving floor space and needing no return pump, all condensation draining back directly to the boiler. The fan is run in summer as well as winter, for ventilation. The air is distributed through elevated sheet iron ducts, with branches leading down to within a few feet of the floor. The general lighting is by gas arcs. Individual electric lamps are now being placed on some of the machines.

Pattern Shop.

The pattern shop is small, but conveniently arranged and well equipped. It contains the usual bench, laying-out table, band saw, trimmer and lathe. The latter is of double ended spindle construction for turning large wheels on a face plate at the left end of the head.

There is a standing rule in this department which is worthy of more general application, i.e., all shavings and scrap must be cleaned up every night.

Most of the work is on spoked blank wheel patterns of standard design. Like most other things, there is one right and a good many wrong ways of building these patterns, but fortunately in this case the way that is best in the end is also the easiest.

Tool Room.

The tool room is one of the most important parts of a plant of this nature, and one usually much neglected in small shops. In the present case, it has been developed very carefully. One whole side is of glass with no obstructions to cast shadows; and the other three are wire mesh partitions. Compressed air and gas are piped along the bench. This department contains an F. E. Reed tool room lathe, an ordinary tool grinder and a LeBlond Universal cutter grinder.

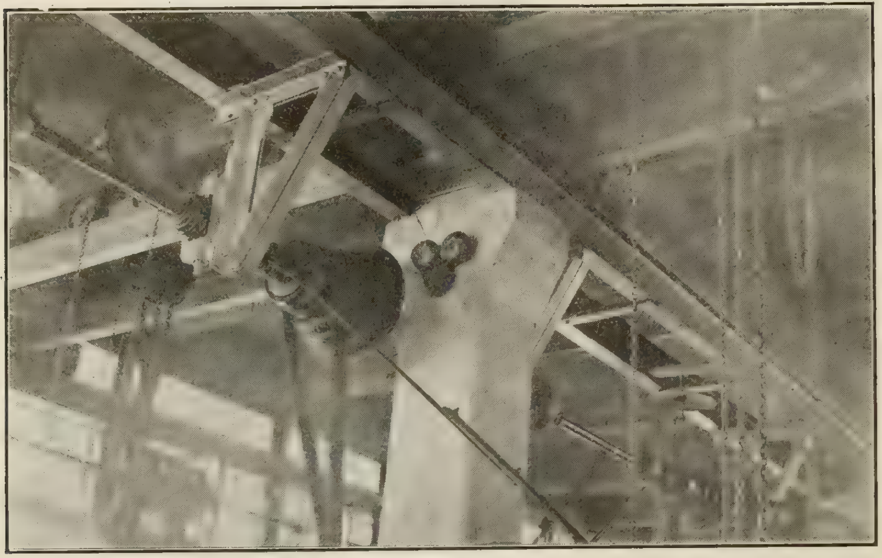


FIG. 2. CRANE BRACKET AND SHAFTING ARRANGEMENT.

An essential feature of the gear business is the large stock of cutters and hobs needed, and which must always be kept sharp. These are practically all of high speed steel. After sharpening, every cutter is tested in a special fixture as to whether the front faces have been ground truly radial and for equality of height of the teeth. A stock of ready sharpened tools for the lathes is kept in the tool room. These are ground in jigs to Taylor standard shape.

There are no permanent shelves in this room, all the tools being arranged in cabinets and small shelf sections which can be easily re-arranged in different locations to suit expansion without disorganizing the general plan.

Lathes.

The lathe department occupies the south part of the middle and west bays. The engine lathes are of F. E. Reed and R. McDougal Co. make, one of the latter being a large gap lathe. A Jones & Lamson turret lathe, size 3 in. x 36 in., with individual motor is used for repetition work, and gives thorough satisfaction. As this machine has no compound rest or diagonal feed as ordinarily constructed, it might be thought that it would be at a disadvantage on such work as wide-faced cast iron bevel gear blanks, but this is not the case. A roughing formed tool with a corrugated cutting edge is used to act as a scale breaker and is followed by a finishing formed tool. It is found that cast iron bevels can be turned very rapidly, even with extra wide faces, by forcing these tools directly up to the work without lateral feed.

High speed steel is used exclusively, both for turning and drilling. All drills are of the concave twisted type, which combine the advantages of form of the milled drill and the high duty of the flat twisted type. The use of taper shanks one Morse number larger than standard has been found a great advantage.

In this department there is a new, motor driven high speed saw, having a capacity of 9 inches diameter. With this machine, large steel pinion blanks can be got out on a few minutes notice. A full stock of a high grade of open hearth steel bars is kept on hand besides a fair amount of the more expensive alloy steels for automobile and special gears. A good stock of rough rawhide blanks and partly machined brass flanges is also carried from which rawhide pinions can be made up on short notice of any face and any diameter up to about nine inches. A large range of lengths and diameters of soft steel rivets is an important item in getting out rawhide pinions economically and promptly as those most used are over the ordinary lengths.

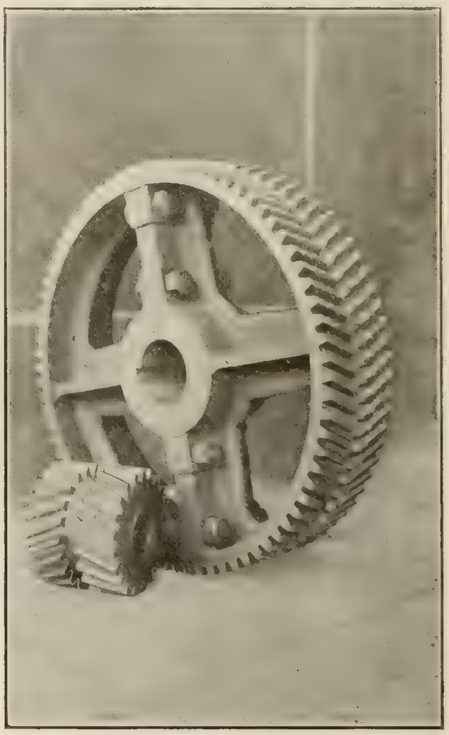

FIG. 3. DOUBLE HELICAL GEARS.

At the middle of the shop, between the lathe and gear cutting sections, are located the shaping, drilling and key seating machines. The use of a special key-seating machine far out-classes the shaper or slotter for convenience, accuracy and speed. The machine used in this shop can handle work up to 8½ feet in diameter.

Spur Gears.

Spur gears are cut on Brown & Sharpe 84 in. and Gould & Eberhardt 48 in. machines. These are in the north part of the west bay, all bevel gear machines being in the north of the centre bay. Some very heavy work has been turned out by this shop, which is natural on account of the ample equipment to handle it. Next to the spur gear machines is a Kearney & Trecker, Milwaukee, "all-geared drive" universal milling machine. With a special head and some additional fixtures, this machine provides means for cutting helical and double helical gears up to 4 feet in diameter, and racks up to 10 feet in length.

Helical Gear Production.

Far greater exactness of work and especially of calculation is required for helical gears than is generally supposed. For double helical gears, such as those illustrated, an additional pair of compound change gears, having the same ratio as those being cut, is inserted in the lead gears when cutting the gear. These are omitted when cutting the pinion and the balance of the train of lead gears left unchanged, thus maintaining the correct ratio of leads of gear and pinion beyond possibility of error.

There is also equipment for hobbing worm wheels up to 9 feet in diameter.

Bevel Gears.

The part of the shop devoted to bevel gears is equipped entirely with Gleason machines. These comprise a 60-inch gear shaper, a 24 inch gear shaper, an 18 inch bevel gear generator and a bevel gear testing machine. The first two named are similar in construction. A single tool is used which planes the gear tooth to a curve copied from a templet. A roller, travelling on this templet is mounted at the rear or free end of the shaper guides. The guides swivel at the front end, both vertically and horizontally about a point which agrees with the cone centre of the gear being cut. With the tool properly located, every cut taken is on a line leading directly to the cone centre of the bevel gear. Three changes of tools are needed for each gear, a stocking tool and finishing tools for the upper and lower sides of the teeth. Correspondingly, there are three templets used, the first of which has a straight edge.

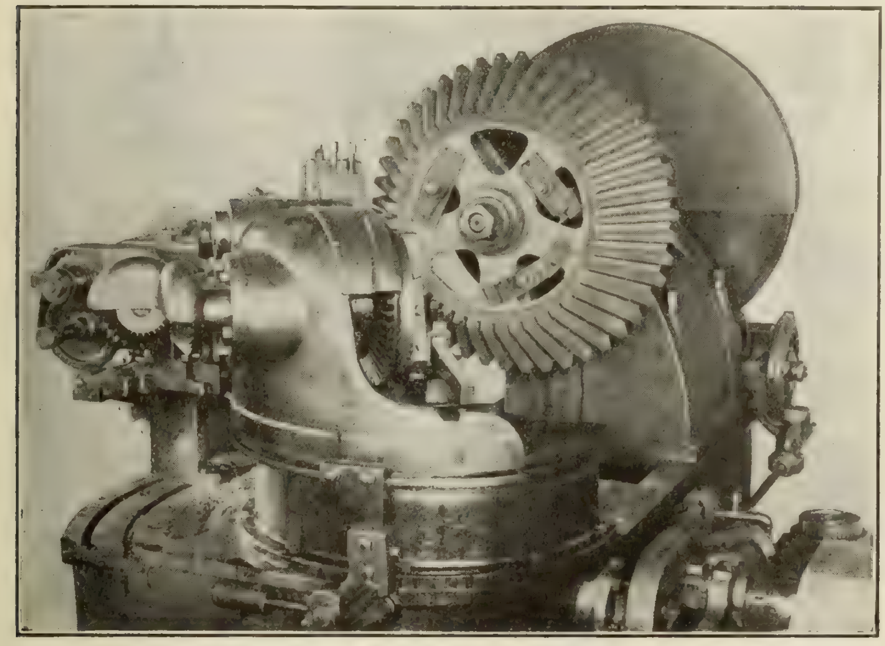

FIG. 4. LARGE BEVEL GEAR ON 60-INCH GLEASON PLANER.

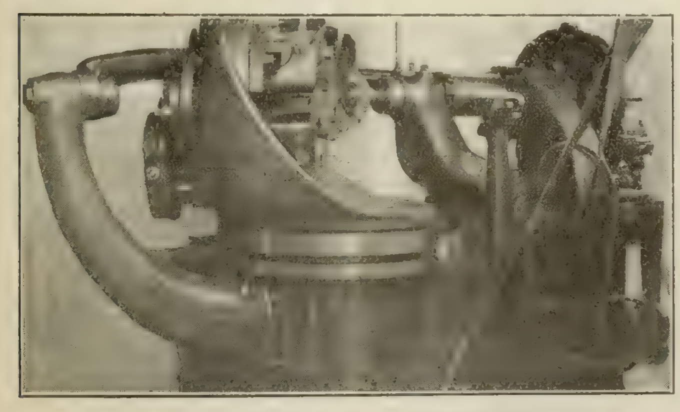

FIG. 5. BEVEL GEAR GENERATOR.

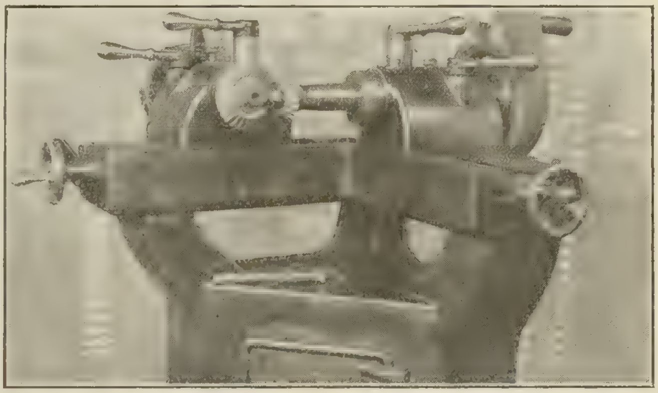

FIG. 6. BEVEL TESTER.

The 60-inch machine is equipped with templets for teeth of 20 degree pressure angle as well as the usual 14½ degree. The 20 degree is a stronger tooth than the 14½, especially in the case of pinions for high ratios and small numbers of teeth, as it avoids much of the undercutting of the flanks of the teeth usual in these cases. It is also the better form for patterns from which moulded gears are to be cast, as it draws from the sand more readily than the 14½ degree.

Bevel Gear Generator.

The bevel gear generator is a double tool machine and uses no templets. It forms the tooth mechanically by the "moulding generating" process. The tooth being cut is rolled between the two straight sided tools. These travel back and forward while the machine rolls, and thus form a theoretically correct tooth. As the tooth is shaped by the side of the tool taking a thin paring or shaving cut, it follows that a very high finish is obtained by this method as well as extreme accuracy. This machine is also equipped for the 20 degree tooth as well as the usual form.

The generator is a very fast cutting machine for work within its range, but it requires longer to set up, hence its field lies in repetition work. The single tool gear shapers are more efficient on small quantities and are the best for the general run of work.

Bevel Gear Testing Machine.

The bevel gear testing machine consists of a frame in the form of an exact right angle, each leg of which carries a headstock and spindle which can be accurately adjusted along the slide. By this means, a pair of bevel gears can be mounted at right angles and in the same plane, and the depth of meshing, adjusted as desired. One of them can then be driven forward or backward and a brake applied to the other; red lead can also be used on the teeth to indicate whether they are bearing evenly. These tests are for accuracy of workmanship solely. Strength tests are only made on quantity work, when a sample is taken and tested to destruction.

One of the principal difficulties met in doing a general line of bevel gear cutting is the matter of errors in blanks sent in by customers. The blanks are frequently incorrectly turned and unnecessary trouble ensues. On the other hand, men who are turning gear blanks continuously do this work with ease and accuracy.

The Hardening Room.

The well-equipped hardening room is one of the most interesting parts of the plant. A hardening department can give a greater range of good results or trouble than almost any other branch of mechanical work, and a complete but not too elaborate equipment is absolutely necessary for success.

A large Brown & Sharpe furnace is used for case-hardening and heat-treating gears or other steel parts. The door is 12 inches high by 24 inches wide and the oven is 4 feet 10 inches deep. It is of very heavy constructions, slow to heat up, but giving constant and reliable results when once heated. It burns Lehigh egg coal with an air blast, consuming about 150 pounds per day, and an additional 100 with natural draft at night.

Only one heat of steel per day is put through. The work is packed in semi-steel boxes in the carbonizing material, which may be bone or one of the manufactured chemical compounds, and the lid sealed with clay. The boxes are placed in the furnace at 5 o'clock, and removed about the middle of the following afternoon. This slow heating is a much surer and safer way than the short quick heat commonly practiced. The steel is allowed to cool slowly in the sealed pots and is not unpacked till the following day when it is reheated and quenched to harden. After this, it may, if desired, have the temper drawn.

The temperature and length of time for which the steel is carbonized depend on the kind of steel, the thickness of case and the carbon content of the case desired. The temperature to which it is reheated, the kind of quenching liquid and the temperature at which the temper is drawn also vary with the kind of steel and the work for which it is intended. Figure 7 shows the bins of carbonizing material at the left. The main stock of this is of course kept in the store room. Above the bins is the electric pyrometer indicating temperatures in the furnace.

In front of the furnace are a couple of empty carbonizing boxes and to the right is the oil quenching tank. This is provided with a water jacket through which cold water can circulate from the bottom and overflow to the sewer. A compressed air pipe at the bottom of the oil tank keeps the oil agitated so that it gets the full benefit of the cooling jacket. There are also brine and running water tanks, one of which is 6 feet deep, for quenching long pieces endways. Large pieces of steel are handled with overhead pulleys and there is a trolley and run-way for removing the hot pots from the furnace.

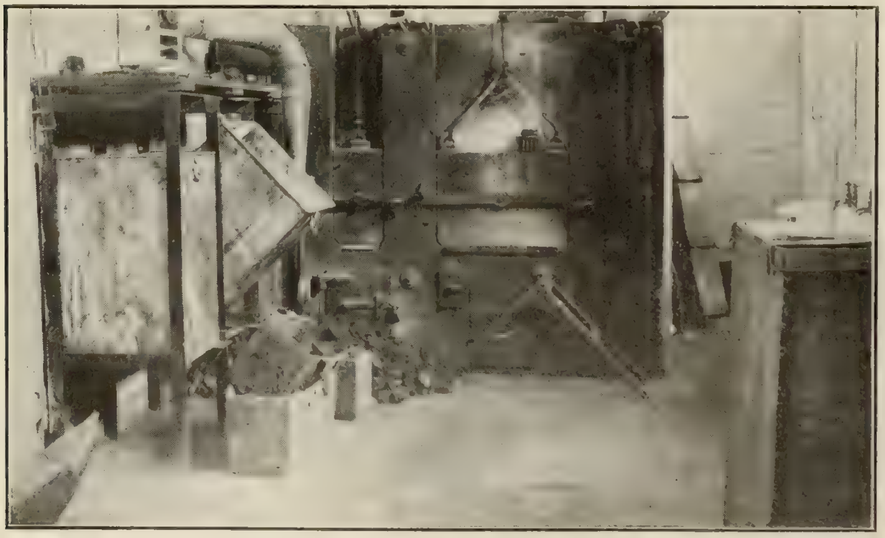

FIG. 7. HARDENING ROOM, GEAR END.

Tool Furnaces.

The other end of the hardening room, Fig. 8, is devoted to tool work. Besides the ordinary forge equipment, a small gas fired tool furnace with pyrometer connection is shown at the right. This furnace is not capable of treating high speed steel, and its use is therefore limited. The high speed steel furnace is shown at the left.

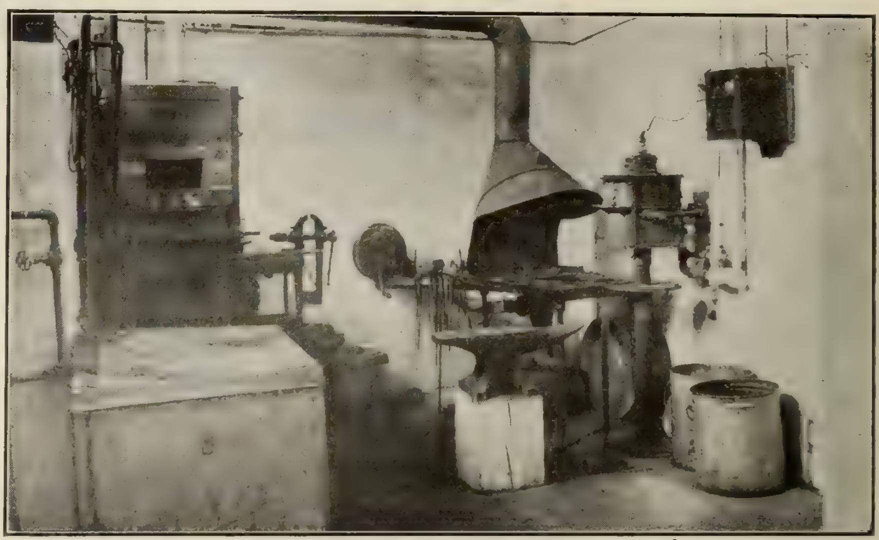

FIG. 8. HARDENING ROOM, TOOL END.

After looking over the various furnaces on the market, it was decided to build one on original lines. This was done and it has proven a success. The fuel, coke, is fed from an elevated hopper in the rear to grates in a very deep fire box. This attains two ideals at once —a continuously replenished fire which is never dulled by fresh fuel, and a deep fuel bed which prevents oxidation of the steel tool. The furnace is very cheap to operate and behaves more like an oil than a solid fuel furnace. Tools must of course be pre-heated slowly in a moderate fire to avoid the injury that would be sure to result from exposure of cold steel to intense heat.

Employes Safety.

There is one point concerning this plant deserving of special mention; that is, the question of personal safety. Great pains have been taken to secure conditions of safety on every side. There are neither projecting set screws, unguarded gears nor dangerous belts in the plant, and the liability insurance rate is, we are informed, the lowest in the Province. While it will probably never be possible to make a machine shop "fool proof" there is no reason why it should not be made reasonably "danger proof" for the mechanic of even average intelligence.

* * *

THE DIAMOND MFG. CO., LTD.

THE Diamond Mfg. Co., Ltd., have leased parts of two floors in the Walker Power Building at Walkerville, Ont. The total floor area occupied by them is 6,540 sq. ft., and equipment is being installed for manufacturing automobile radiator parts, wind-shields, lock steel tubing and weather strips for buildings.

On the first floor are installed a number of machines for making the necessay tools, dies, etc., while on the ground floor, special machinery will be installed for manufacturing the product. Operations were started in October of this year. The Diamond Mfg. Co. of Detroit, Mich., is the parent concern. Mr. Newman is manager of the Canadian Company.

Plant and Product of The Ford Motor Co. of Canada, Ltd.

Staff Article

The automobile industry in Canada has in recent years shown much vitality, and the chief feature of this development has been the factory built by the Ford Motor Co., of Canada, Ltd., at Ford, Ont. It is the largest of its kind in the Dominion, and this article will no doubt be read with keen interest on account of the popularity of the Ford Car.

THE history of the Ford Car has been one of phenomenal success, and a visit to the Canadian home of the "Ford" will in a great measure explain the reason for this. The reasons which are perhaps chiefly responsible for this success are standardizing the design of the car together with efficient manufacturing methods and organization. The growth of the company since its inception, nine years ago, is an indication of the success that has been attained.

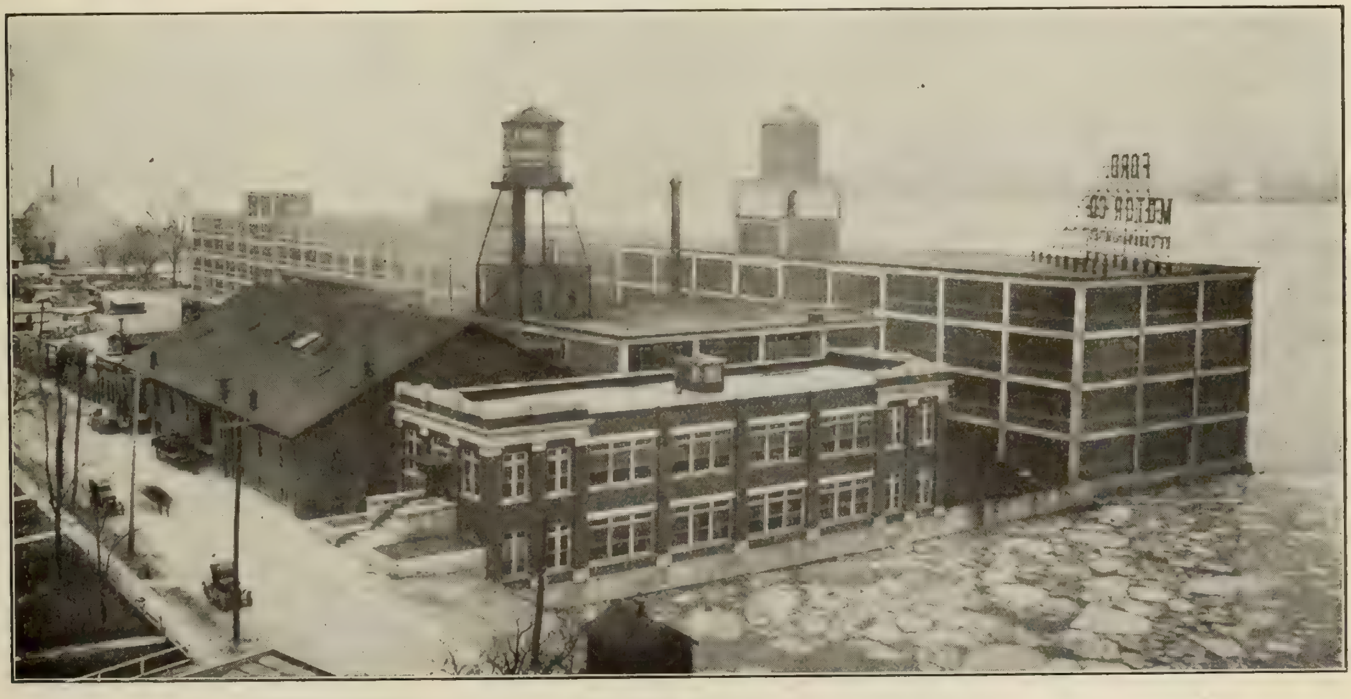
The Ford Motor Co. of Canada, Ltd., was organized in 1904 by the Ford Motor Co. of Detroit, Michigan, who even at that time were operating a large factory in the latter city, and have since increased enormously both the plant and the output. The first car was shipped from Walkerville, Ont., in 1905, and since that date the progress has been both rapid and continuous, so much so, that in 1910 a three-storey concrete building, with about 19,000 square feet of floor space, was built and completed in January, 1911. In the same year, another reinforced concrete building was erected, having four floors 75 feet by 200 feet, containing 60,000 square feet of floor area, and built over the river bank. A new office building was also built this year.

In 1912 the capital stock of the Company was increased from $150,000 to $1,000,000 and the name changed to the Ford Motor Co., of Canada, Ltd. About this time, the district in the vicinity of the factory was incorporated as a town and given the name of Ford. This district adjoins the town of Walkerville, but the town of Ford has a separate municipal organization. In 1902 another concrete factory was built 75 feet wide by 505 ft. long and was a continuation of the 1911 building. This extension completed the main building which is now 705 feet long by 75 feet wide, and is built parallel to the river. The Company have a site covering 60 acres situated on the Detroit River and have a siding connection with the Grand Trunk and Essex Terminal Railway. On that part of the property across the main road and directly opposite the factory, a modern power house and boiler room have been built. The location of the plant is good as cheap power in the form of natural gas is used and shipping facilities to the various markets are of the best.

The Ford Car.

The Ford Car is made in three styles, a runabout, seating two passengers, a town car seating six persons, and a touring car carrying five people. In each case, however, the chassis and power plant are the same size and design, the rating being 20 h.p. It is thus possible to standardize the design and simplify methods of manufacture. This has been the aim of the Company from its inception, and has been largely responsible for the large output each year; 20,000 cars being the estimate for next season.

The company have embodied some

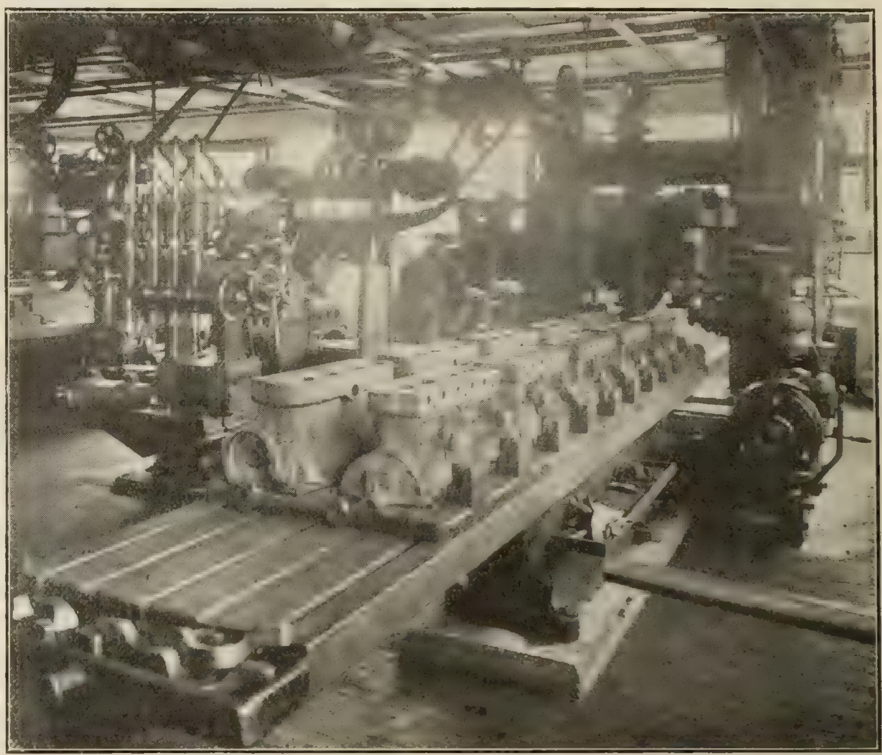


GENERAL VIEW OF PLANT—THE FORD MOTOR CO. OF CANADA, LTD.

distinctive features in the design of the car, the principal being the "Ford" magneto, which is made by the company, the use of vanadium steel for gears and crank shafts, etc. The left hand drive is employed for cars used in Canada with the exception of British Columbia, the Maritime Provinces and foreign countries where the right-hand drive is used. Planetary type transmission has been adopted as standard. Many of the component parts used in the car are made by various companies in Walkerville and district who specialize in certain parts, such as wheels, castings, drop forgings, bodies and tops. The total floor space occupied by these companies for the manufacture of the parts named is nearly equal to the floor space at the Ford factory. This feature will serve to show the extent of the Ford Company plant and connection.

Building Features.

The large main building was erected by Wells & Gray, Contractors, Toronto, and is 705 ft. long by 75 ft. wide, and four storeys high. It is of reinforced concrete and brick construction and as fireproof as it is possible to make it. The windows are fitted with "Kahn" steel sash and ribbed glass, extending all round the building and admitting plenty of light, thereby giving a very bright and pleasing interior effect. Hardwood floors are laid throughout, and dust is practically eliminated. As an additional precaution against fire, an automatic sprinkler system has been installed throughout by the Automatic Sprinkler Co., of America. On the roof are two water tanks having a capacity of 25,000 gallons and 40,000 gallons respectively.



MILLING CYLINDER CASTINGS—TOPS AND SIDES.

The buildings are heated by a forced circulation of hot water which is pumped from the boilers to four coils on the roof. Air is drawn over the coils by fans and is blown through ducts on the roof of the building to the several columns which are hollow, and equipped with register openings. A constant temperature of 65 degrees Fah., is maintained at all times. Four 5-ton Otis-Fensom electric elevators have been installed in the main factory building.

GLEASON GEAR CUTTING AND SHAPING MACHINES.

There is a bell system installed on each floor which consists of two 10-in. gong bells placed in suitable positions. The bells anounce the factory hours and can be used for fire calls. For the lighting system 60 watt "Bergman" lamps are installed throughout.

The comfort of the employes has been well taken care of. On each floor are rows of lavatories, and sanitary drinking fountains are located at various points. The different departments on each floor have each a time recording clock which were supplied by the International Time Recording Co., Toronto. A covered passage connects the main building with the office block.

Part of the old building is still being used. On the ground floor is the blacksmith shop, a general store room, and shipping room. On the 2nd floor are the shipping office and superintendent's office, and the third floor is devoted to the manufacture of radiators.

Machine Shop.

On the ground floor of the main building is the machine shop which occupies the whole area. This is perhaps the most important department both from a production and investment standpoint. In this shop, jig work and methods of production have been reduced to a science. There are a number of special machines designed by the Company for their own particular requirements, in addition to those of standard make, and which are found in every up-to-date machine shop.

At the east end of the machine shop is the tool room where jigs and special tools are made for the various operations connected with the machining of the engines, etc. Some of the machine tools employed for this work have been specially designed for the purpose, the rest include standard tools such as Brown & Sharpe universal milling machines, Warner & Swasey turret lathes, multiple drills by the Foote Burt Co., Cleveland. lathes by the Hendey Machine Co., Torrington, Mass., drills by the Cincinnati Bickford Co., Cincinnati, and No. 2 milling machine by Kearney & Trecker Co., Milwaukee. High speed steel is used in this department for making cutters, etc., and the work is inspected at frequent intervals to ensure accuracy.

The machine shop is divided into sections so that no stock traverses the whole length, each part being kept in its own particular section. There are sections devoted to machining cylinders, pistons, crank cases, crank shafts, gears and small parts like cam shafts and transmissions. To facilitate the operation of this system, three electric freight elevators have been installed by the Otis-Fensom Co., to carry stock up to the assembly floor above and to bring the finished cars down. An overhead runway extends the full length of the shop and carries a 2-ton Sprague electric hoist. The larger machines have independent motor drives while the others are grouped in their respective sections and operated from a motor driven line shaft. The motors in this shop were supplied by the Canadian Westinghouse Co., and vary in size from 25 h.p. to 40 h.p., according to the number and size of machines in the sections.

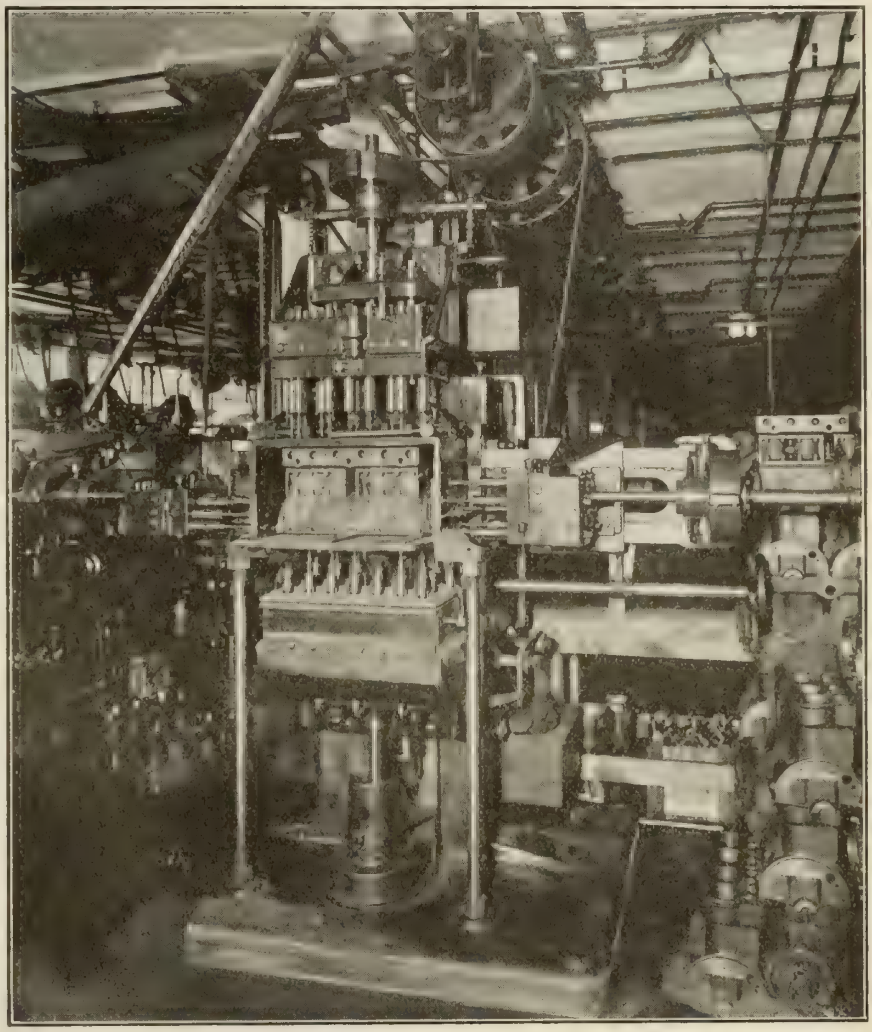
The heaviest machinery is grouped at the west-end where the motor cylinders are machined. The cylinder castings are taken from the stock room to a large milling machine which finishes in one operation the sides and bottoms of ten cylinder castings or forty individual cylinders. This is a horizontal machine and was made by the Ingersoll Milling Machine Co., Rockford, Ill.

The cylinder heads are machined on an Ingersoll Miller, and the bottoms of the cylinder castings finished on a machine of the same type. The four cylinders in one casting are bored, at one operation, on a 4-spindle boring machine, which is equipped with a rising table to take care of the feed. After being bored, the cylinders are reamed and finished on a similar machine to the above. The next operation consists of drilling the cylinder castings, which is done in a number of multiple drilling machines, having four, six, twelve or sixteen spindles, the majority being supplied by the Foote-Burt Co., Cleveland, O., and the Cincinnati Bickford Co. One special Foote-Burt machine drills forty-one holes in a single casting at one operation.

Next to the cylinder section of this shop are several piston machines which in a single operation face the piston tops and sides and grooves for the rings of four piston castings at once. The piston is then practically finished and ready for the stock room with the exception of letting in the bronze bushing for the wrist pin.

In the next section are the Gleason gear cutting machines for machining the differential drive gear and pinion. There are ten of these machines in one row which first make the roughing cut on the gears. In the next row are fourteen Gleason gear shapers, which make the finishing cuts. The cutters take the gear blank and cut the required number of teeth, coming back automatically to the next starting point, as between operations, the gears must be heat treated.

There are of course a number of machine tools involved in the various operations carried on in this shop, and in addition to those already referred to it may be of interest to mention a few of the others. It should be stated that there are in some cases several of one type which include hobbing machines by the Barber-Coleman Co., Rockford, Ill.; Brown & Sharpe milling machinery, lathes by Hendey Machine Co., Landis No. 3 grinders, Warner & Swasey turret lathes, grinders by Fox Machine Co., Grand Rapids, a Gould & Eberhardt milling machine for machining bearing caps, Milwaukee milling machines and Kearney & Trecker milling machines. A large number of these machine tools were supplied through the A. R. Williams Machinery Co., Toronto.

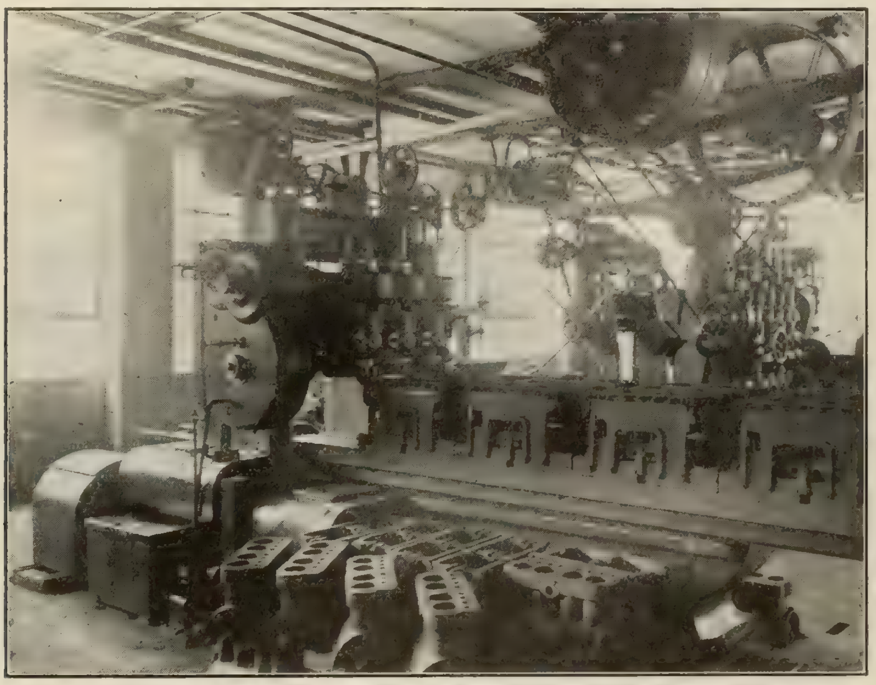


MULTIPLE SPINDLE CYLINDER DRILLING MACHINE.

Assembling Shop.

The second floor, that immediately above the machine shop is taken up by the painting and motor assembly departments; there is also a store room for finished parts. In the painting department there is a wheel painting machine which was supplied by the Detroit Tool

Co. This machine has the appearance of a centrifugal dryer, and revolves the wheels in successive tanks of paint and varnish. After this operation, they are taken out and dried and then fitted with tires and sent along to the final assembly. The other parts are all painted by hand.



MACHINING ENGINE CYLINDER BOTTOMS.

The greater part of this floor is taken up by the motor assembly section where the different parts are carefully fitted together. First, the crank and timing gear are fitted to the cylinders, then the magneto and transmission are bolted in place. When completed the motors are placed on a test stand, of which there are five, and are then connected to an electric motor and run at a high speed. This operation in addition to being a test for the engine and magneto provides an opportunity for ''running in'' the bearings and making necessary adjustments. Each testing set is equipped with a switchboard fitted with an ammeter and voltmeter. The ''Ford'' magneto is assembled in this shop. At the west-end of this floor is the store room for finished parts in connection with the motor assembly.

Final Assembly.

On the third floor is the final assembly where the chassis, including power plant, frame, front and rear axles, wheels and bodies are put together. In assembling the cars, each man has his particular work to perform, moving from one car to another as his work is completed. This system enables the maximum speed to be attained with the greatest degree of accuracy. When the cars are completed they are taken down to the testing room where the rear wheels are jacked up and the final test run. If required for immediate shipment they are taken to the shipping room, if not, which is rarely the case, they are taken up to the top floor of the main building and held until required.

At the west end of the final assembly department is a store room for finished parts which are carried to the assembling department by a portable crane hoist supplied by W. S. Nicholls, New York. Leading from this floor but in the older building is the radiator department where the ''Ford'' radiators are made. Each stage of manufacture can be seen from the plain brass sheets to the painting of the finished product which is done by a compressed air spraying machine.

The fourth or top floor of the main building is used entirely as a stock room for such parts as motors, bodies, tops, etc., and occasionally for finished cars.

Heat Treatment.

On leaving the main building we pass along outside to the heat treatment department where one of the most important operations relative to the product is carried out. As already stated, vanadium steel is used in the Ford cars. All parts made of this material must receive special heat treatment before being assembled in the cars; this is done by heating them in specially designed furnaces at a certain temperature, for a definite time, to give them the necessary toughness and elasticity. There are eight of these furnaces built of brick, heated by natural gas, and equipped with electrically controlled pyrometers.

On the opposite side are the furnaces for brazing brass parts, such as radius rods. In another section are the babbitting machines, six of which surround a ladle of molten babbitt heated by natural gas. Into these machines are fed the connecting rods whose crank pin boxes are lined with babbitt. Alongside the wall in another section are a row of blacksmith's fires, where crank shafts and front axles, etc., are straightened. In this shop are the furnaces for tempering the differential and transmission gears. The shop is part of the old plant, but a new heat treatment building is being erected adjoining the present one.

HEAT TREATMENT DEPARTMENT.

Power Plant.

Crossing the road we come to the power house which is a brick building of handsome appearance and about 60 ft. square. The roof trusses are steel with a concrete roof. The windows with steel sash extend almost the full height of the building and on three sides. The walls inside are lined with white glazed brick, with the result that this is perhaps the brightest and cleanest power house t obe seen anywhere. The equipment generally is of the most modern type.

The power installation consists of two horizontal gas engines made by the Hooven, Owens & Rentschler Co., Hamilton, Ohio, to the designs of Edward Grey, an engineer on the staff of the Ford Co. at Detroit. Both engines are identical in design except that they are right and left-hand. They are operated as separate units, but can be operated together if necessary. They are of the double acting, tandem 4-cycle type, each having two cylinders 24 ins., diam. by 36 ins.stroke, and rated at 750 h.p. each; giving a total of 1,500 h.p. available. The length of each engine overall is 40 feet. The crank shaft is 18 ins. diameter by 14 ft. long, and carries a 20 ton flywheel. The cam or lay shaft is 4¾ ins., diam., 14 feet long and weighs 1,900 pounds. This shaft runs alongside the engine on the floor and operates the valves located on the underside of the cylinders which are easily accessible from the floor under the engine room. The natural gas which the engines use is piped from Tilbury, Ont., 40 miles distant. Each engine runs at 150 r.p.m., and is direct-connected to a 450 k.v.a. 60-cycle Crocker-Wheeler revolving field 3-phase generator, and excited by a 17 k.w. Crocker-Wheeler belt driven exciter. Each engine has cennected to it an air compressor which is driven from the crank shaft. Each compressor is rated at 100 h.p., and will deliver 500 cub. ft. of free air per minute.

Switchboard.

The switchboard is of the automatic type and was supplied by the Canadian General Electric Co. It has panels made of natural black slate and is mounted on iron pipe framework with a full complement of instruments which have a dull black finish. The switchboard controls are as follows: — 2-480 volt, 500 k.w. 3-phase, 60-cycle engine driven generators; 2-110 volt, 17 k.w. exciters; 1-35 k.w. 110 volts, exciter direct connected to a 50 h.p. motor; 3-180 feeders; 1-100 k.w. 3-phase transformer; 3-35 k.w. single phase, 3 wire lighting feeders.

The apparatus controlling the above is mounted on a bench board to be seen in the illustration. The bench board is fitted with a number of switches and illuminated indicators. A 20-ton hand-operated overhead Niles travelling crane is installed and mercury vapor lamps are used for lighting.

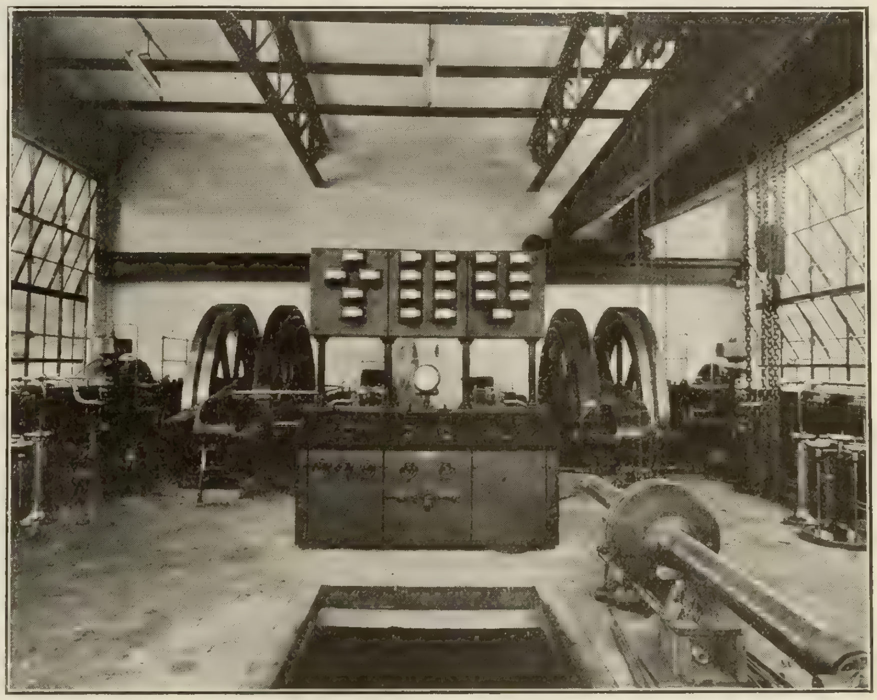
It will be interesting to note that there is operating at the Detroit factory a 5,000 H.P. gas engine made by the same firm as the one described above. This unit is perhaps one of the largest gas engines installed in a factory on this continent.

Boiler Room.

The boiler room is located near the power house and is connected to it by an underground passage terminating in the basement. The building is of substantial brick construction, 90x80 ft., and has steel roof trusses with concrete roof. The windows are fitted with "Kahn" steel sash and ribbed glass; a number being made to open, permitting of ample ventilation.

There are installed four Goldie & McCulloch horizontal return tubular boilers of 90 h.p. each, 60 in. diameter by 16 ft. long. The boilers are capable of carrying 140 lbs. steam pressure, but at present are running at 90 pounds. Each boiler is equipped with a set of burners for using natural gas as 11 ozs. pressure. Near the boilers is a Goldie & McCulloch No. 4 "Ideal" feed water heater rated at 125 h.p. and, in connection with it, a duplex boiler feed pump, 5½x3½x6 ins. for boiler feeding. A "Burnham" vacuum pump 16x18 ins. takes the drains from the heating system and returns them to the heater.

In the basement, under one end of the boiler room, are two 6-in. steam turbine double suction centrifugal pumps for pumping hot water from the boilers to the heating coils on the roof of the main factory building. Each pump has a capacity of 1,000 gallons per minute against a head of 50 ft. at 2,500 r.p.m., and is direct connected to a No. 5 Buffalo Forge Co. "Spiro" steam turbine, developing 22 h.p. at 90 lbs. steam pressure, non-condensing. Adjoining these sets is a 1,000 gallon Worthington duplex steam pump for supplying water to the two tanks over the main factory building.



INTERIOR OF POWER HOUSE.

In the boiler room is installed a steam-driven air compressor supplied by the Bury Compressor Co., Erie, Pa. This machine has cylinders 12x12x12 ins. stroke with a capacity of 310 cu. ft. of free air per minute against a pressure of 100 pounds at 200 r.p.m. Under these conditions it is rated at 62 h.p. It is fitted with cushioned poppet inlet and discharge valves, and has forced feed lubrication. All the high pressure steam pipes are fitted with crane extra heavy fittings, and Philip Carey Co. pipe covering is used throughout the plant.

General Features.

The office building is bright and well furnished, and from it can be obtained a fine view of the Detroit River. The general organization and manufacturing methods are modelled after those in force at the Detroit factory whose engineers have always been available for advice and assistance when necessary. Automobiles are shipped from Ford to all parts of the British Empire, and we understand that the demand is increasing rapidly each year. An interesting periodical, the "Ford Times," is published monthly. It is worthy of note that the capital stock of the company is largely

Canadian, and that local labor is employed as much as possible. About 1,500 employees are on the pay-rolls at the present time.

The officers of the company are Henry Ford, president, James Couzens, vice-president; G. M. McGregor, secretary-treasurer and general manager; and W. R. Campbell, assistant manager.

A CANADIAN TOOL STEEL PLANT.

IN the large new tool steel and twist drill plant of Armstrong, Whitworth of Canada, Ltd., now nearing completion at Longueuil, Que., an important addition has been made to Canada's manufacturing facilities in the metal trades. The new plant, which is large enough to supply a large proportion of Canada's high speed crucible steel requirements, is thoroughly modern. The parent English firm of Sir W. G. Armstrong, Whitworth & Company, Ltd., with its several huge plants, is one of the oldest and largest manufacturers of crucible tool steel in the world. The new Canadian plant profits from this experience, commencing its operation with all advantages of equipment and processes that have been found desirable by the older Company. It will manufacture high grade tool steel, including the celebrated "A.W", "T.Y.R" and "A.W.Premier" brands, drills, reamers, cutters, taps and dies, machine tools, cranes, forgings, lock and dock gates, etc. With complete equipment for the manufacture of these standard lines, and also of special steels where required, and with production capacity large enough to supply all reasonable requirements, the new plant will supply a real need in the Canadian metal trades. It is the Company's intention to carry a complete and ample stock of standard lines, so as to insure quick deliveries.

PLANT OF ARMSTRONG, WHITWORTH OF CANADA, LTD., UNDER CONSTRUCTION.

The plant itself embodies the most modern ideas, in layout, construction and equipment. The illustrations give a partial view of the main building, which is located near the main line of the Quebec, Montreal & Southern Railway. There are seven separate buildings—all under one roof, and connected by an alley-way. One end and both sides are permanent in construction, but the other end is only a shell of timber and plaster. Thus all seven buildings may easily be extended when future requirements demand. The departments are:—(1) Raw materials, (2) Crucible factory, (3) Crucible castings department, (4) Steel foundry, (5) Steel foundry, (6) Rolling mill department, (7) Hammer department, (8) Tool steel warehouse, (9) Hardening department, (10) Small tool shop. Material passes through departments in the order named to the hammer department. After annealing, bars are ready for shipping in that state or for further manufacture into drills, taps, reamers, milling cutters, etc.

Excellent daylight is provided by windows that occupy fully 60 per cent. of the wall area and also by the eighteen skylights—Artificial light is supplied by flaming arc lamps and tungsten lamps. Heating throughout the plant is accomplished by the vacuum steam system which utilizes the 400 h.p. of exhaust steam that would otherwise be wasted.

Electric overhead traveling cranes, manufactured by the Whiting Foundry Equipment Co., serve each department, except the small tool shop. The steel foundry crane is of 15 tons capacity, but 5-ton cranes are sufficient equipment for the other departments. Steam hammer equipment includes hammers ranging from three tons to four hundred-weight.

There is a wide range of size and capacity in the battery of furnaces, including small tempering furnace, mufflers, hammer forgings and annealing furnaces, reheating furnaces, and on up to the large crucible furnaces.

The boiler and gas houses are entirely separate from the main buildings and each is laid out with a view to future extension at the lowest cost and least inconvenience. A battery of 1,000 h.p. Babcock & Wilcox boilers is the present installation. The chimney is 150 ft. high and is capable of handling double the present boiler equipment.

As a whole, the plant is laid out and equipped according to the best modern practice.

NEW C.N.R. PLANS.

THE Canadian Northern Montreal Tunnel & Terminal Co., Ltd., have filed plans with the Railway Commission for a revised location of its tunnel line from the water front to the point of junction with the main line.

The previous location had been approved by the Commission after several hearings held in Montreal, but it has become desirable to make one or two changes. One of these, as shown by the revised location, is that they will take only 50 feet of a right-of-way under the mountain instead of 100 feet as first planned. This may lessen the land damages paid to owners under whose property the tunnel will run.

It is not thought the railway board will raise any objection to the revised location, as it does not involve any further damage to property rights, the centre line of the right-of-woy being unchanged along its length.

Mr. S. P. Brown, chief engineer of the Canadian Northern Tunnel, states that no drastic changes in the tunnel are indicated by the plans placed before the Railway Commission. When the original plans were filed they provided for a right-of-way of 100 feet, in order that should the tunnel deviate from the plans the right-of-way would not be exceeded. Now that the tunnel is through, revised plans had been filed, showing the actual tunnel as constructed and having a fifty-foot right-of-way. When the work was finally completed this would probably be reduced still further.

Plant of the International Malleable Iron Co.

GUELPH · ONT.

STAFF ARTICLE

The new plant which the International Malleable Iron Co., Guelph, Ont., have built for the manufacture of malleable iron castings indicates development in what is becoming an increasingly important industry in Canada. Much foresight has been shown in the layout of the plant to secure maximum output.

THE International Malleable Iron Co., Ltd., have built a large foundry at Guelph, Ont., for the manufacture of malleable and grey iron castings, at the eastern end of the city, on a site covering about 12 acres and adjoining the Canadian Pacific Railway tracks. The company is operating under the auspices of the Illinois Malleable Iron Co., of Chicago, Ill., who, in conjunction with W. A. Mahoney, architect, Guelph, were responsible for the lay-out and construction of the plant; they will, therefore, have the benefit of the experience gained in this class of work by the parent company who are one of the largest manufacturers of malleable castings in the United States. The site is level, and being near the railway, every facility is offered for the receiving of the raw materials and the shipment of the product; a siding on the property leads into the stockyard where will be laid an industrial track system, when materials will be conveyed directly into the foundry. The siding also passes along, outside the annealing room where coal is delivered direct from the cars to the annealing oven furnaces, through openings in the wall.

At the present time only malleable iron castings are being produced, but provision has been made for making grey iron castings when the company desire to do so, the main endeavor at the outset being to have the malleable plant completely equipped. Excellent progress has been made in this respect, the latter being practically complete, with the exception of the addition of special machinery, such as the class of work calls for. A modern office building and a machine and pattern shop will be erected in the near future. These departments are occupying temporarily parts of the main building, the offices in the south-west and the machine and pattern shops in the south-east sections. The section where the offices are now located will eventually be used as a pattern storage. A cleaning room will replace the machine shop. As the class of work becomes more definite and therefore standardized, special moulding and other machines will be installed.

Buildings and Lay-out.

The lay-out of the buildings and loca

FOUNDRY INTERIOR, SHOWING MOLDING FLOOR.

tion of the equipment provides for the handling of the raw materials and product as expeditiously as possible with a consequent saving in operating expenses. The system is continuous, from the time the raw materials leave the cars to the arrival of the finished product in the shipping room, one process follows another consecutively; in no case have the castings to be "brought back" for any particular treatment.

The buildings are of substantial brick construction and are light and well ventilated, wood columns and wood roof trusses with steel tie bars being generally used with a 2 in. wood roof covered with roofing material. The columns in the machine shop and annealing room are of steel. The monitor roof in the moulding bay has windows which open all the way along. The contract for the brick work was carried out by Taylor Bros., Guelph, and the wood work by Ibbertson Bros., also of Guelph, the rest of the work being done by the company.

The main building is 470 feet long and 103 ft. wide, and lies east and west. The moulding bay or foundry occupies the larger part of this, being 362 ft. long by 103 ft. wide, while the machine shop at the east end is 108 ft. long and 69 ft. wide, the remaining 34 ft. being occupied by the cleaning room, which is 108 ft. long. At the south side of the cleaning room is the annealing room which is 108 ft. by 121 ft. Returning to the west end of the main building, we have, on the south side, the pattern storage 50 ft. by 20 ft. and core rooms 125 ft. by 50 ft. Adjoining the pattern storage are the offices, and beyond are the lavatories; two buildings, 33 ft. by 24 ft. The power house is 35 ft. by 48 ft., and is situated at the north-west corner of the main building. Between these buildings is the cupola, and a room where the heating apparatus is installed.

Foundry.

The foundry, as has already been stated, is 362 ft. long and 103 ft. wide, and is divided into three bays, the centre being 53 ft. wide and the side bays 25 ft. wide. The centre bay has a monitor roof with windows all the way along, operated from the floor, and a lantern built to allow for the Wickes boiler being enclosed. The side bays are well lighted, windows being placed along the walls except where other buildings prevent this. At the north-west corner is a 54 in. Sheldon cupola for use when the company desire to make grey iron castings. The blast for the cupola is furnished by a Sheldon blower direct connected to a 20 H.P. Canadian Westinghouse motor. The hoist for carrying materials to the charging floor has a capacity of 4,000 lbs., is electrically operated and was supplied by the Otis-Fensom Elevator Co., Hamilton, Ont.

In the centre of the foundry and grouped together, are the air furnace, boiler and stack. Along the walls on each side are the moulding benches for light work, and of which there are about 50, and a number of machines which include 18 air machine squeezers of the company's own design and some hand squeezers supplied by the Adams Co., Dubuqe, Iowa. It is the intention to install a number of special moulding machines later. Compressed air is piped along the walls in 4 in. pipes with $1\frac{1}{2}$ in. connections for each set of two machines. There is a stove for drying ladles which will take care of about 12 at one time.

The core rooms are on the south side of the foundry and connected with it by a passage, a core room being on each side. In one of these, men are employed, and it is the intention to employ girls in the other room. A "Millet" oven has been installed for light cores and also a truck oven 15 ft. by 20 ft., which is large enough to hold four trucks, each of four tiers high. On one side are a number of shelves under which is the fire grate where coke is used for heating the oven. The oven is of the company's design and manufacture.

Air Furnace.

The air furnace is of brick construction and was built to the designs of the Illinois Malleable Iron Co., Chicago. It is rectangular in shape and has a capacity of 15 tons each heat, two heats being drawn each day, morning and afternoon, making a total of 30 tons when operating at full capacity. At the end away from the stack is the fire grate

FOUNDRY INTERIOR SHOWING AIR FURNACE.

where gas coal is used for heating the furnace. The draft is supplied by a Sheldon blower direct connected to a 20 h.p. Canadian Westinghouse motor, which delivers air at a pressure of 3 ozs., under the grate bars through the main vertical duct which is connected to 6 smaller ducts fitted in the furnace above the bridge wall. At this point the pressure is reduced to .75 oz. The gases coming over the bridge from the fire are deflected down and distributed in the furnace by the blast. The opening at the end of the furnace shown in the illustration is the ash pit under the grate bars.

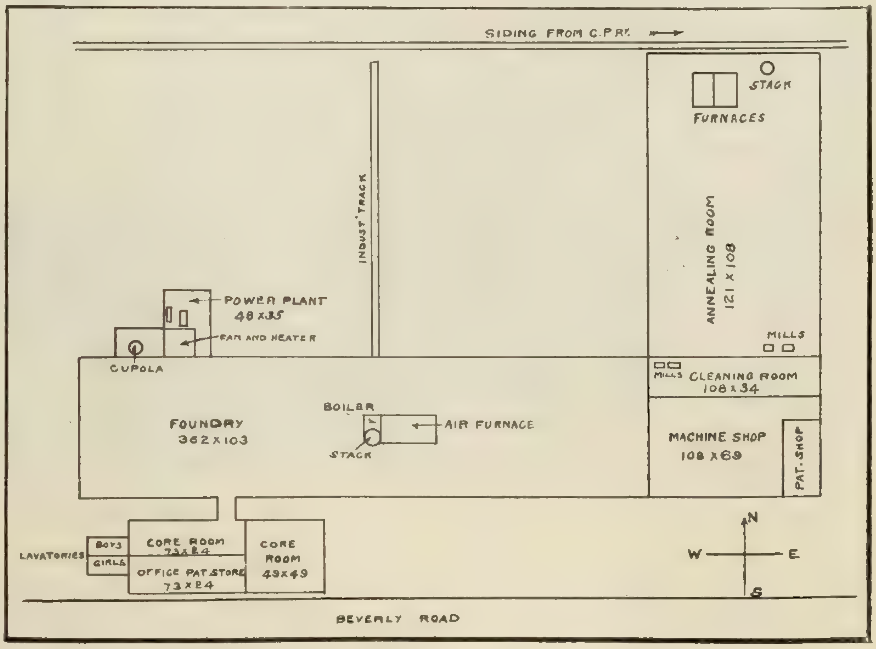
In operation, the furnace is heated up, then charged first with sprue and steel scrap through an opening in the top made by removing one or more bungs. These bungs are iron castings faced with firebrick, and can be seen in the illustration leaning against the furnace. The bungs are handled by means of a runway and hoist seen above the furnace. The pig iron is next fed through a door at the side, the same door being also used for skimming the metal, skimming taking place twice during each heat. When the metal is ready to be tapped, the men line up on both sides of the furnace, there being a tapping hole on each side, some with 50 lb. ladles and two men handling the larger or bull ladles holding about 100 lbs. The metal is carried to the various molds in the small ladles for bench work, and in the large ladles for floor work.

Boiler.

A waste heat boiler has been installed in connection with the air furnace in order to utilize the large amount of heat in the gases leaving the furnace. The boiler is a 400 horse-power vertical water tube unit, built and installed by the Wickes Boiler Co., Saginaw, Mich. The design is especially adapted to its particular purposes, as the floor space required for the boiler and auxiliary furnace is a minimum. Another advantage that tends toward the greatest absorption of heat is the long travel of the gases in close confinement to the heating surface.

Fire brick dampers are installed at suitable locations to permit the use of the boiler as a direct fired unit in case the steam is desired when the air furnace is down. The auxiliary furnace is hand fired, and will be used to obtain the desired output from the boiler during the charging periods in addition. A waste heat by-pass flue around the boiler to the stack has been provided so that should anything happen to the boiler or boiler setting, it would be possible to take off the heat without damage to the furnace. The total floor space required for the flues, boiler, auxiliary furnace and stack is approximately 25 ft. square. The stack, of perforated radial blocks, is 110 ft. high above top of foundation, and was built by the Alphons Custodis Co., New York. It is 3 ft. 6 ins. diameter at the top, and the foundation of concrete is 15 ft. square by 5 ft. deep. All round column construction is the particular type, and a sectional fire brick lining, 4 in. thick, supported every 20 ft. on the inside by fire brick corbels built out from the main walls, extends throughout the whole height.

The stack is built for high temperatures, the inner core being not only of firebrick, but in addition having the main walls reinforced by internal steel bands built at intervals into the masonry. Between the lining and the main walls there is a 2 in. air space, and each section of lining is built free at the top to allow for expansion under high temperatures. The particular feature of construction is that all the blocks are cut on radial lines to fit the diameter. They are also perforated vertically, the mortar in the horizontal joints entering the holes, keying the blocks, as it were, together. The material is manufactured exclusively for chimney blocks, and has a crushing strength averaging over 6,000 lbs. per square inch.



PLANT LAYOUT, THE INTERNATIONAL MALLEABLE IRON CO.

Cleaning and Annealing.

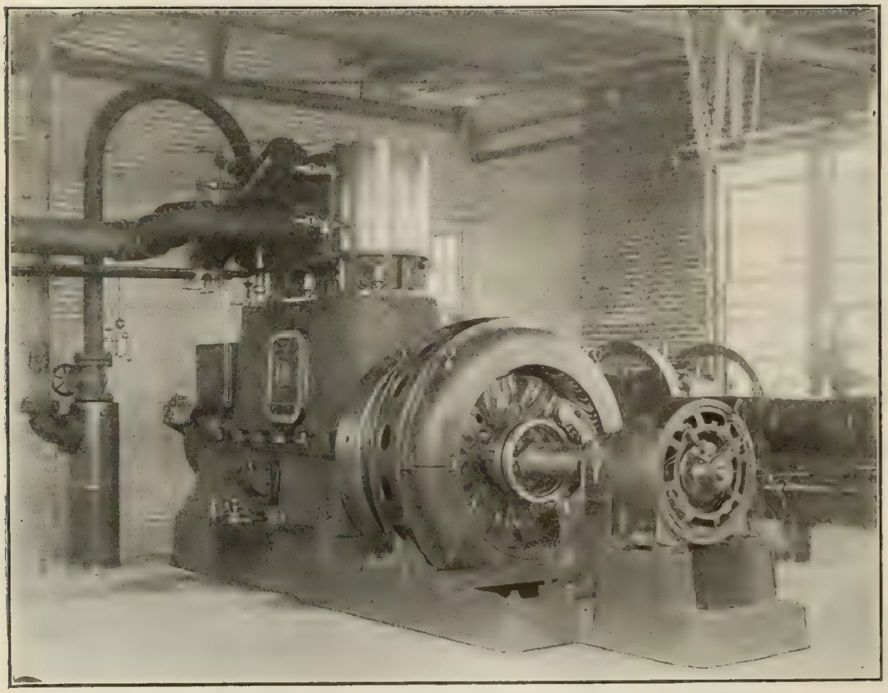
When the castings have cooled off, they are taken from the flasks and wheeled to the cleaning room, where they are first put in the hard tumbling mills for a preliminary cleaning. There are four hard mills of the Company's own design, each being 2 ft. 6 in. diameter by 5 ft. long, and the battery is driven by a 15 h.p. Canadian Westinghouse motor. After being removed from the mill, the castings are taken to the cleaning benches, where the gates, etc., are broken off, and then sorted and weighed on a Fairbanks scale located at the door of the annealing room. The weight of each batch is noted by the operator at the scales, also the number and name of moulder, shop number of the job, order number, kind of work, number of pieces in batch. These particulars are entered on a sheet, which, together with the foundry foreman's records, form a system of checking the work for the pay rolls, etc.

After being weighed, the castings are wheeled to the annealing room, where they are packed in pots with mill scale, which is a form of oxide of iron. The pots are made of iron, open at the sides, and are put into the annealing oven by a charging machine. Each oven will hold 46 pots, four high. They remain there about seven days, during which time the heat is gradually brought up to the desired temperature, then cooled down.

When the castings have been annealed, they are taken to the soft tumbling mills for final cleaning. There are four soft mills also made from the Company's own design, each mill being 2 ft. 6 in. diameter by 5 ft. long, and driven by a 15 h.p. Canadian Westinghouse motor. Castings that are too light to be tumbled are cleaned by a pickling process. When taken from the mill, the castings are wheeled to the shipping room on one side of the annealing room, and sorted and bagged ready for shipment.

Annealing Ovens.

There are two annealing ovens made entirely of brick and well stayed. They were built from designs furnished by the Illinois Malleable Iron Co., and have each a capacity of 25 to 30 tons. It is intended to build another annealing oven alongside the present set. The front of each oven is bricked up after being charged. At the rear end are the fires which use gas coal. The gases pass from the fire, and are then deflected upwards by a brick wall, passing along over the pots to the front end, where they are drawn down through the flues and back under the furnace floor to the stack. The latter, of brick, is 90 feet high, and was also built by the Alphons Custodis Co., New York. For taking the temperature of the ovens a ''Pycos'' pyrometer is used; it can be switched to either oven. The pyrometer was supplied by the Taylor Instrument Co., Rochester, N.Y. A railway siding runs along outside, and coal is fed into the annealing room through openings in the wall.



"LEONARD" ENGINE AND GENERATOR WITH "BURY" COMPRESSOR.

Machine and Pattern Shops.

The machine shop is situated at the eastern end of the main building, part of which is used as a pattern shop, the latter being 40 feet x 20 feet. At the opposite end is a store room for shop stores. In the pattern shop are a number of machines, the principal being a Thomas core-box machine by the Portland Co., Portland, Me.; an Oliver No. 3 wood trimmer and a 38 in. band saw by the F. H. Clement Co., Rochester, N.Y. The machines in this department are driven by a 20 h.p. Canadian General Electric motor.

The tools in the machine shop are for plant equipment, repair purposes for the most part. Several special machines have, however, been installed for threading malleable elbows, tees, unions, etc. These latter are not in operation at present, but will be when this line of product has been fully developed .

The principal machines include a 12 in. drill by the Hamilton Tool Co., Hamilton, Ont.; a power press by Brown, Boggs Co., Hamilton, Ont.; a Windsor Machine Co. 10 in. turret lathe; a power hack saw by D. MacKenzie, Guleph; a ''Landis'' bolt threading machine, 13 in. and 9 in. lathes by the American Tool Works Co., Cincinnati; a Brown & Sharpe universal milling machine, a similar tool by the Canadian Machinery Corporation, Galt., Ont. Special machines include a Warner & Swasey turret lathe converted into a union machine; a special union machine supplied by the Illinois Malleable Iron Co., and four tapping machines by the Williams White Co., Moline, Ill. These machines are specially designed for tapping malleable iron elbows and tees. The main line shaft is driven by a 30 h.p. Can. Westinghouse induction motor.

Power Plant.

The power house contains a ''Leonard'' high speed engine, rated at 300 i.h.p., running 375 r.p.m., with steam pressure of 125 pounds. It is of the vertical compound type, with cylinders 15 and 20 in. diameter by 10 in. stroke. The engine is totally enclosed, and is equipped with oil relay expansion gear operating the high pressure valve and regulating the cut off in accordance with the engine load. The engine is direct connected to a 150 k.v.a. Canadian Westinghouse generator supplying current at 600 volts, 3-phase, 25 cycles. The 6 k.w. exciter is on the main shaft. The switchboard was supplied by the Canadian Westinghouse Co., and has two slate panels equipped with 3 ammeters, a voltmeter, and the necessary switches.

The air compressor was supplied by the Bury Compressor Co., Erie, Pa., and is of the horizontal simple steam driven type, with cylinders 12 and 12 diameter by 14 in. stroke. Its capacity is 330 cubic feet of free air per minute at 180 r.p.m., against a pressure of 100 pounds, and under these conditions approximately 66 h.p. can be developed. The steam and air cylinders are in a straight line, and have a common piston rod. The compressor has an enclosed crank case, and is fitted with the ''Bury'' automatic, pneumatic forced lubrication system, designed to increase the efficiency of the machine, and to reduce loss of oil to a minimum. The air inlet and discharge valves are of the cushioned poppet type, rendering the compressor noiseless in operation. The air receiver is 48 in. diameter by 12 feet long, and is situated in the foundry.

An ''Ideal'' feed water heater and purifier is installed, and was supplied by the Goldie & McCulloch Co., Galt. It is an open type heater, 5 ft. diameter by 14 ft. high, and is fed with city water by gravity and heated by exhaust steam from the engine. Feed water is pumped to the boilers by two 7½-4½-10 in. duplex pumps, which were supplied by the Canadian Allis-Chalmers Co. The steam pipes and fittings are extra heavy quality, and were supplied by the Crane Co., Chicago. They are covered with Johns-Manville Co. asbestos pipe covering. A hand travelling crane is installed and equipped with a 2 ton chain block.

Heating System.

The heating system was installed by the New York Blower Co., Chicago, and consists of a 200 in. steel plate motor driven fan, standard for 60,000 cu. ft. of air per minute, together with a heating coil of sufficient capacity to heat the above quantity of air to around 120 deg. through 12,000 lineal feet of 1 in. pipe arranged in two groups. The heating coil is raised to a sufficient height so that the water drains back to the feed water heater. The apparatus is designed for using exhaust steam from the main engine and steam supplied direct from the boiler through a pressure reducing valve. The apparatus operates on low pressure steam at all times.

The buildings heated consist of the main foundry, cleaning room, machine shop, pattern shop, and core rooms. The warm air is distributed through galvanized iron ducts running the whole length of the foundry, with branches leading off at various points for distribution. The fan is located in a separate room near the power house.

General Features.

The entire plant is lighted by tungsten lamps, those in the foundry and machine shop being 100 watt and in the annealing and core rooms 250 watt, 110 volts, while current is distributed to the motors at 550 volts, 25 cycle, 3 phase.

The officers of the company are: H. E. Bullock, President; P. D. Ivey, Vice-President; C. H. Ivey, Secretary, and W. H. Burgess, General Superintendent.

PROGRESS ON THE QUEBEC BRIDGE, 1913.

THE close of the year 1913 sees the work of constructing the huge 1,800 ft. cantilever bridge across the St. Lawrence River above Quebec well under way. In point of length it will rank as the longest span in existence, and in point of weight will also take a place as one of the world's largest bridges. The new Hell Gate bridge over the East River at New York, for the New York Connecting Railroad, is the only structure in progress or contemplation which exceeds the Quebec Bridge for weight of steel involved.

The construction of both main and anchor piers of the Quebec Bridge has now been completed on both sides of the river. These occupy the same centre line as the original bridge which collapsed in 1907, but are all farther to the south. The old piers have been removed down to two feet below low water mark, so as to cause no disfigurement to the view. Both main piers were constructed with caissons under pneumatic pressure and extend down to bed rock. The anchor piers on shore are above high water mark, and also extend down to bed rock. The whole of the sub-structure work has been carried out by the well-known firm of M. P. & J. T. Davis.

The contractors for the superstructure are the St. Lawrence Bridge Co., Ltd., Montreal, who have erected a large plant at Rockfield, Que., a few miles west of Montreal. This plant was described in the issue of "Canadian Machinery" for May 22 last. It has been designed primarily for the economical handling of this particular contract. The company have built at the bridge site, on the north shore, a completely equipped camp to accomodate about four hundred men, which is about the largest staff that will be employed on the actual erection work. The camp has the usual dining hall, kitchen, bunk houses, hospital and other buildings; but is unusually well built and furnished, having even a special water service and sewerage system. This is made the more necessary by the fact that it will be in practically constant use for a period of five years, instead of for one season only.

Close to the north abutment of the bridge a power plant has been installed furnishing air and electric current for the work. Power is purchased from the Quebec Railway Light, Heat and Power Company at 22,000 volts, three-phase, 60 cycles. The plant contains at present two Ingersoll-Rand 16 in. x. 10 in. x 14 in. compressors, belt driven by 100 h.p. induction motors. Space has been provided for two additional machines. Since all the motors used on the work will use direct current at 230 volts, two 250 k.w. 250-volt D. C. generators direct driven by two k.v.a. 2,200-volt synchronous motors are already in place. Later on a similar plant, except that the primary voltage is 11,000, will be put in on the south side of the river. This is not required at present, as construction is being commenced on the north shore first.

On this shore all the approach spans have been erected by means of a derrick car. They consist of two single track bridges side by side, each containing one span of 110 ft. 7½ in., and one of 157 ft. 10½ in. Work is now in progress on the erection traveller for handling the main spans. This machine is in itself a large contract, as it weighs about 920 tons in working order, and stands 205 feet high above the rails on which it runs. An illustration is shown of this traveller in course of erection on the north shore.

In the erection of the anchor arms steel falsework will be used exclusively. Two separate systems are required, one carrying the floor system and erection traveller, and the other the main trusses of the anchor arm. Most of the material for this falsework is already stored at the bridge site, ready for the opening of the season of 1914.

Over 6,000 tons of finished material for the bridge is now in storage on both sides of the river. This consists principally of track girders, track stringers, floor beams, sub-floor beams and floor bracing. The first of the enormous main shoes is now practically finished at the shops, and the second is well advanced. The construction of the bottom chord members and bottom lateral bracing is also under way. More than 1,500 tons of erection material have been fabricated and shipped from Rockfield, wholly for use on the north for the present. It is expected that a part at least of the steel falsework can be used again on the south shore, although the erection traveller will be duplicated on that side.

The concrete footings for the falsework posts have been finished on the north shore; so that as soon as the ice goes out in the spring of 1914 the traveller can commence the erection of the steel for staging. It is hoped to erect the north anchor arm complete during 1914, with the possible exception of the main post.

NEW C.P.R. ELEVATOR AT WEST ST. JOHN, N.B.

A NEW grain elevator which embodies the latest ideas in elevator design has recently been completed at West St. John, N.B., for the Canadian Pacific Railway, and received its first consignment of grain at the beginning of December. It has a capacity of 1,000,000 bushels, and was designed and constructed by the John S. Metcalf Co., Ltd., Montreal, the work having been carried out under the direction of J. M. R. Fairbairn, assistant chief engineer, C.P.R.

The elevator and the tracks serving it stand upon new ground, which was formerly beach. As the tide at St. John has a maximum rise and fall of 28 feet, the work of putting in the foundations was a matter of some difficulty, as the foundations extend for the most part below low water mark and the work was done before the earth fill was made. The building is 195 feet long, 93 feet wide and 202 feet high above track level, the foundations going 30 feet lower. The bins are of reinforced concrete on concrete columns, the latter resting on concrete piers going down to the rock. They are circular in form and 84 feet deep, the walls being 7 inches thick. The total number of bins is 171. Ten of the bins are used as shipping bins, with a capacity of 12,000 bushels each. The five-storey cupola is of structural steel covered in with corrugated galvanized sheeting, the floors and roof being of concrete. There are eight elevator legs, each with a capacity of 12,000 bushels per hour. From the garners the grain passes to eight Fairbanks 2,000 bushel hopper scales, which deliver to sixteen Mayo distributing spouts with a radius of 25 feet. The scales also distribute to two 36-inch transfer belts, which run the full length of the house, and can deliver to any of the Mayo spouts.

There are four receiving tracks running through the house, cars being handled on any of these by an electric car puller. The receiving capacity is 160 cars per ten hours, the grain being discharged into the 16 receiving hoppers by mechanical unloaders. The shipping capacity is 30,000 bushels per hour to steamships, the grain being carried to the wharves by two 36-inch belts in a conveyor gallery, which also connects with the C.P.R. No. 1 elevator. Provision has been made for doubling the shipping capacity when required.

All machinery is driven by induction motors, each unit having an individual drive. Current is supplied from a power house adjacent to the elevator. This contains two turbo-generator sets of 500 k.w. capacity each. Three-phase current at 550 volts, 60 cycles, is delivered by the generators, which were made by the Canadian General Electric Company. The turbines are by the Allis-Chalmers Co., Milwaukee. The condensing apparatus is of Worthington make, and was supplied by the John McDougall Caledonian Iron Works, Montreal. The condenser is of the counter-current barometric type, with a motor driven centrifugal circulating pump and a steam driven vacuum pump.

Steam is raised in four return tubular boilers built by the Jenckes Machine Co., Ltd., the working pressure being 150 lbs. per square inch.

All the elevating and conveying machinery was supplied by the Dodge Mfg. Co., Toronto, and the Canadian General Electric Company supplied all the motors, the wiring for these and the lighting having been done by W. J. O'Leary & Co., Montreal. The Dominion Bridge Co., Montreal, supplied the structural steel work, while the corrugated covering was done by the Montreal branch of the Metal Shingle and Siding Co., Ltd.

DOMINION BRIDGE COMPANY IN 1913.

THE Dominion Bridge Co., Ltd., Montreal, have had a very successful year during 1913. The annual report submitted to the shareholders on December 17 showed net profits, after allowance for bad and doubtful debts, for depreciation of plants and buildings to the amount of $832,778, or equal to 12.8 per cent. on the Company's $6,500,000 stock. There is no bonded indebtedness and all securities are in one class of stock.

The profits were appropriated as follows: $5,750 in bonuses voted by shareholders, $565,699 in dividends, $153,053 was added to reserves and $15,714 written off organization expenses, while $92,561 was carried forward to profit and loss, bringing that account up to $409,276, against $316,715 the previous year. Reserve accounts have been increased from $619,393 to $756,870.

Mr. Phelps Johnson, President of the Company, in his report to shareholders, stated that the output of the various plants had been 76,073 tons, an increase of 13,026 tons over the previous year, and that the increase would have been considerably larger but for the congested condition of all steel mills during the early portion of the year. Had the supply of steel been available as promptly in the early part of the year as towards the end the total output of Dominion Bridge would have been in the neighborhood of 90,000 tons.

"Business entered during the past year," said Mr. Johnston, "totalled approximately $6,500,000, and the gross value of the contracts charged up as fully completed and considered in the profit and loss statement for the past year is $5,621,010, while work to the approximate value of $8,650,000 is being carried forward into the new year, on which expenditures amounting to $5,446,471 have been made."

Owing to the unsettled condition of the steel market, it had been deemed wise to write down the value of all stock material on hand to a very conservative figure. Important extensions had been carried out at the Lachine, Winnipeg, Toronto and Ottawa plants, which placed the Company in a comfortable position to handle new business.

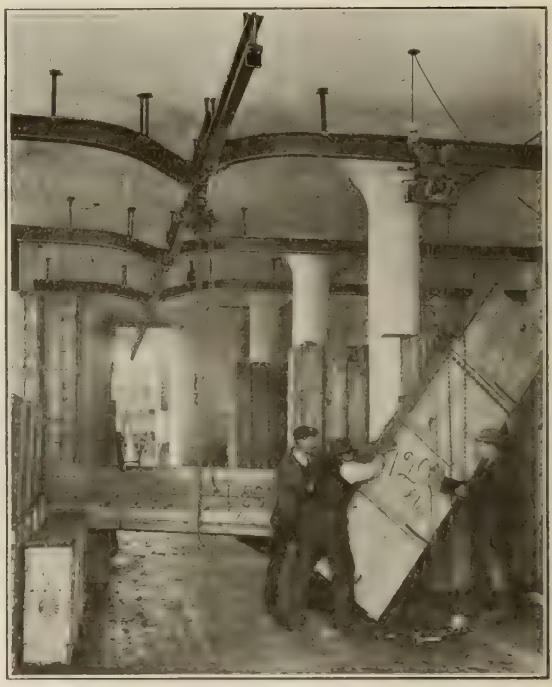
Outlook for Next Year.

Dealing with the general outlook, Mr. Johnson stated: "The business outlook for the current year, while not as bright as it was twelve months ago, is still far from discouraging and with the large volume of unfilled orders carried forward, the majority of which are entered at profitable prices, your directors look forward with confidence to a continuance of the favorable results now shown."

The balance sheet of the Company shows a favorable position, current assets being $1,857,818 in excess of current liabilities. This is the first annual report to be made public. Within the year current liabilities have increased by $1,179,315, but against this has been an increase of $1,358,917 in current assets. Fixed assets, including investments, have increased by over $1,300,000.

THE MORRIS OVERHEAD RUNWAY.

THE extension of engineering methods to general industries is perhaps one of the most significant signs of the times, and a striking example of this trend is given in the accompanying illustration, which represents the interior of the new warehouse of the Calgary Paint and Glass Co. The Morris overhead runway, which was originally designed by Herbert Morris for the transportation of heavy castings and other materials in the machine shop, is here used for conveying large cases of glass, and it is to be noted that the selective feature of this runway permits of a case being picked up in any bay and transferred to the wagon at one handling.



THE MORRIS OVERHEAD RUNWAY.

Another novel feature, adopted from foundry practice, is the construction of the travelling chain block, which is arranged to lower the load by gravity at a rate of 30 feet a minute. This high speed is obtained without risk to the glass or to the operator by fitting to the gearing two automatic brakes, either one of which is powerful enough to hold the full load.

This interesting picture is reproduced by the courtesy of the Herbert Morris Crane and Hoist Co., Ltd.

Canadian Fairbanks-Morse Co. and Allied Companies.

STAFF ARTICLE

"The Departmental House for Mechanical Goods" is the slogan that reflects the policy of the Canadian Fairbanks-Morse Company, Limited, whose wonderful growth during the past sixteen years is proof of what can be done by sound business methods, combined with a determination to give the customer an absolutely square deal.

FROM a small Canadian branch established in 1898 for the sale of Fairbanks' Scales and other goods manufactured or handled by Fairbanks & Co., New York, there has grown up the present Canadian Fairbanks-Morse Company, whose present operations cover the whole Dominion. The Company has eight branches and seven sub-offices, extending from the Atlantic to the Pacific and does an enormous business, the yearly turnover now amounting to between five and six millions of dollars.

To build up this large business has taken unusual energy, initiative and ability, and to Mr. Henry J. Fuller, the President of the Company, belongs a very large share of the credit for the strong position held to-day by the Canadian Fairbanks-Morse Company. Mr. Fuller came to Montreal from New York in February 1898, as representative of The Fairbanks Co., to look over the field and judge of the possibilities for their business in Canada. His firm were not at all sanguine regarding the Canadian field, and a number of years before had closed their Montreal agency on account of the seeming impossibility of competing in face of the Canadian tariff. Upon investigation, however, there seemed to Mr. Fuller to be a large opening for Fairbanks' goods, provided customers could be supplied from stock in Canada. Ultimately he hoped to establish Canadian factories for the manufacture of these goods.

The result of his recommendation was the establishment of a branch at Montreal under his management. Three years later the business had increased to such an extent that branches were opened in Winnipeg and Vancouver, and later in Toronto. In 1905 it was felt that the time had arrived for the firm to manufacture in Canada and become a Canadian concern in fact as well as in name. A large factory was accordingly erected at Toronto for the manufacture of gas engines, steam pumps, tractors and transmission appliances.

The company also control the output of E. & T. Fairbanks & Co., Sherbrooke, Que., makers of the well known Fairbanks scales and Fairbanks valves. They also control the Dominion Safe and Vault Co., Ltd., Farnham, Que., where are made the Fairbanks wood split pulleys, Dominion safes and vaults, and the Midget flour mills.

Departmental Marketing Methods, etc.

The marketing of one article is a comparatively simple matter: but as the number and variety of the lines to be sold increase, the complexity of the merchandising problem increases rapidly. With a view to giving Canadian users of machinery and all classes of mechanical goods the benefits enjoyed by the general public when shopping in the large departmental stores, the company has organized its business along departmental lines, with experts at the head of the various departments. The latter number twelve, as follows:—Scales, Engines, Valves and Steam Goods, Pumps, Electrical Goods, Transmission Equipment, Railway and Contractors' Supplies, Small Tools, Safes and Typewriters, Motor Trucks, Machine Tools and Automobile Supplies.

HENRY J. FULLER.

From the large number of lines that are grouped together under these departments, it will be seen that the Company are in a position to fully equip practically any kind of an industrial plant, and that their claim to have departmentalized a great business is set upon a very solid basis of fact. The huge departmental stores which are now to be found throughout the country are the result of an experience which has proved that the bringing together of a large number of lines and classifying them according to departments makes for increased efficiency and economy, together with improved service, in the merchandising of the goods; and this applies equally well to mechanical goods as to any other line.

New Headquarters Building.

For some time the Company's old headquarters at 444 St. James Street, Montreal, had proved inadequate for conveniently handling the ever-increasing volume of business, and in the summer of 1913 the erection was commenced of a very fine new headquarters depot. This has recently been completed and is said to be one of the most up-to-date of its kind in Canada. It is situated at the corner of St. Antoine and Ste. Cecile Streets, and has a frontage of 94 feet on the former and 144 feet on the latter. It is an extremely handsome building of seven storeys and basement, and has a reinforced concrete frame with brick curtain walls. The front of the building on St. Antoine Street is handsomely finished up to the second floor windows in white glazed terra cotta with ornaments at the head of the pilasters. Two high-speed freight elevators and a passenger elevator have been installed by the Otis-Fenson Elevator Co., while reading and writing rooms for the use of customers are provided, as well as lavatories, locker rooms, etc., for the office staff, which numbers considerably more than one hundred people.

The ground and first floors are used as combined offices and sample rooms, and for retail sales, the idea being to have the goods pertaining to each department in close proximity for the convenience of customers. The third floor is occupied by the head office staff, advertising and purchasing departments, while the fourth, fifth and sixth floors are used for the storage of goods, the top flood being equipped for a repair shop.

With this arrangement the necessity for having a separate warehouse for storing goods is done away with and practically the complete Montreal House business of the Company is carried on under one roof.

The shipping is done from the basement floor at the rear, which is below the level of St. Antoine Street, and provision has been made for a 5-ton motor truck to enter the basement. The front of the basement has been set aside for a demonstration room, with windows so that people on St. Antoine Street can look in. It is proposed to show here gasoline engines, pumps, etc., in operation.

There are from twelve to fifteen separate telephone lines, in and out of the building, with two switchboard operators and an internal telephone system as well.

In a lane at the rear of the building there is a Fairbanks motor truck scale set in a specially deep pit. This pit is connected by a passage and a short iron staircase, with the interior of the building. Visitors can thus inspect the mechanism of the scale in actual operation.

In front of the building on St. Antoine Street is a curb box for free distribution of compressed air for automobile tires. The box is fitted with a lock. a key for which is presented to any automobile owner wishing for one. Inside the box is a small valve and a pressure gauge. By means of the former any desired pressure may be obtained. The air supply is maintained by an automatically controlled Gould compressor driven by a Fairbanks-Morse motor. This compressor set is located just inside the building in the demonstration room in basement. In the basement also, a number of Bowser self-measuring tanks are installed for the storage of gasoline.

The building was erected by E. G. M. Cape, Montreal, and the architects were T. Pringle & Son, Ltd., Montreal, who are to be congratulated on the excellent manner in which they have designed and engineered the structure.

Vancouver Warehouse and Office Building.

The Canadian Fairbanks-Morse Company also erected a new warehouse and office structure in Vancouver during 1913. This is a slow-burning mill construction building covering an area of 20,300 square feet. The site is at the corner of Robson and Beatty Streets, at the west end of the Connaught Bridge. The exterior finish of the building is of pressed brick, with stone trimmings. Extending the full length of the Beatty and Robson Street frontages are large plate glass windows arranged for the display of machinery and mechanical goods. The trackage facilities extend the entire length of the back of the building, giving accommodation for the loading and unloading of six cars.

CANADIAN FAIRBANKS-MORSE CO. HEADQUARTERS BUILDING, MONTREAL.

Between the building and the track there is a 22 ft, unloading platform extending the entire length of the building, this platform being on the same level as the basement floor and the car floor.

Every modern convenience has been installed for facilitating the handling of heavy machinery and mechanical goods, there being an electric travelling crane, with a lifting capacity of four tons, extending out through the receiving and shipping entrances of the building to the tracks, so that goods may be picked up at the car door, carried into the warehouse and deposited at any point on the basement floor, or on the main elevator.

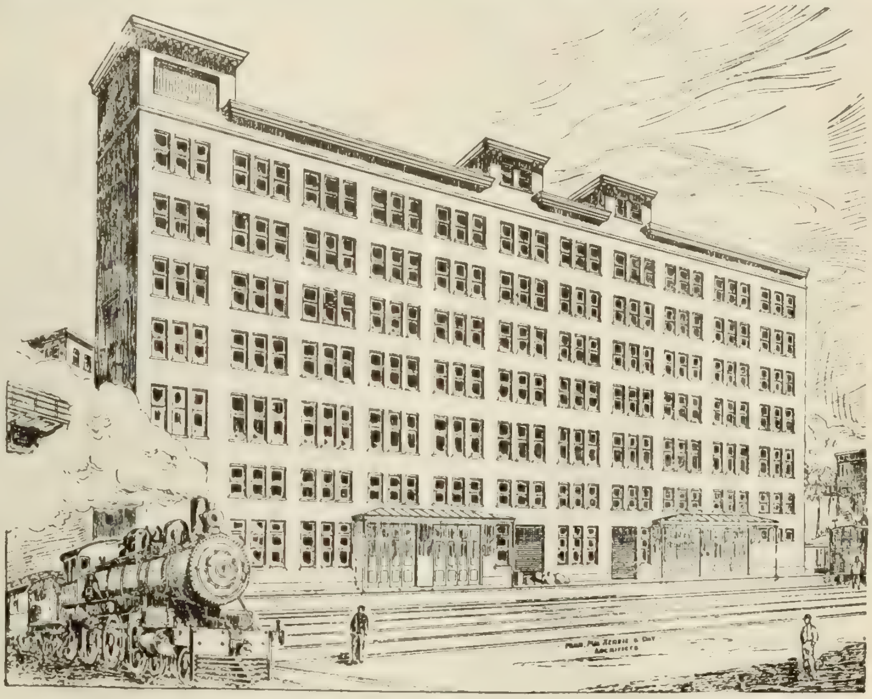
The elevator at the receiving end of the building has a platform 8 ft. x 20 ft. with a lifting capacity of seven tons, and the electric travelling crane is arranged to serve this elevator, thereby eliminating handling heavy machinery and goods by hand. The shipping end of the building is equipped with an elevator having a platform 8 ft. x 8 ft. and a carrying capacity of three tons.

A well equipped machine shop occupies a space on the basement floor 80 ft. long and 45 ft. wide, and the equipment in this shop consists of modern machine tools, 3 motor-driven pipe-cutting and threading machines, and test stand for testing gas and oil engines, the test stand being sufficiently large to accommodate five engines at one time. The steam heating plant is also located in the basement, and is fitted for burning oil. In addition to the regular heating plant there is a garbage burner and heater for supplying hot water throughout the building. The machinery display and city sales department are located on the ground floor, and the same conveniences have been installed for handling the heavy machinery on this floor as in the basement, viz., an electric travelling crane serving all sections of the display floors. Particular attention has been given to the general appearance of this display floor. Instead of the usual rough finish generally seen in warehouses, the ceiling and walls are plastered, the columns cased and panelled with British Columbia fir veneer to a height of 6 ft. The offices are located on the floor above the ground floor, occupying a space running along the entire front of the Beatty and Robson Street sides, giving an office floor space 30 ft. wide x 300 ft. in length.

The plans for this building were prepared by Parr, MacKenzie & Day, Vancouver.

TORONTO PLANT.

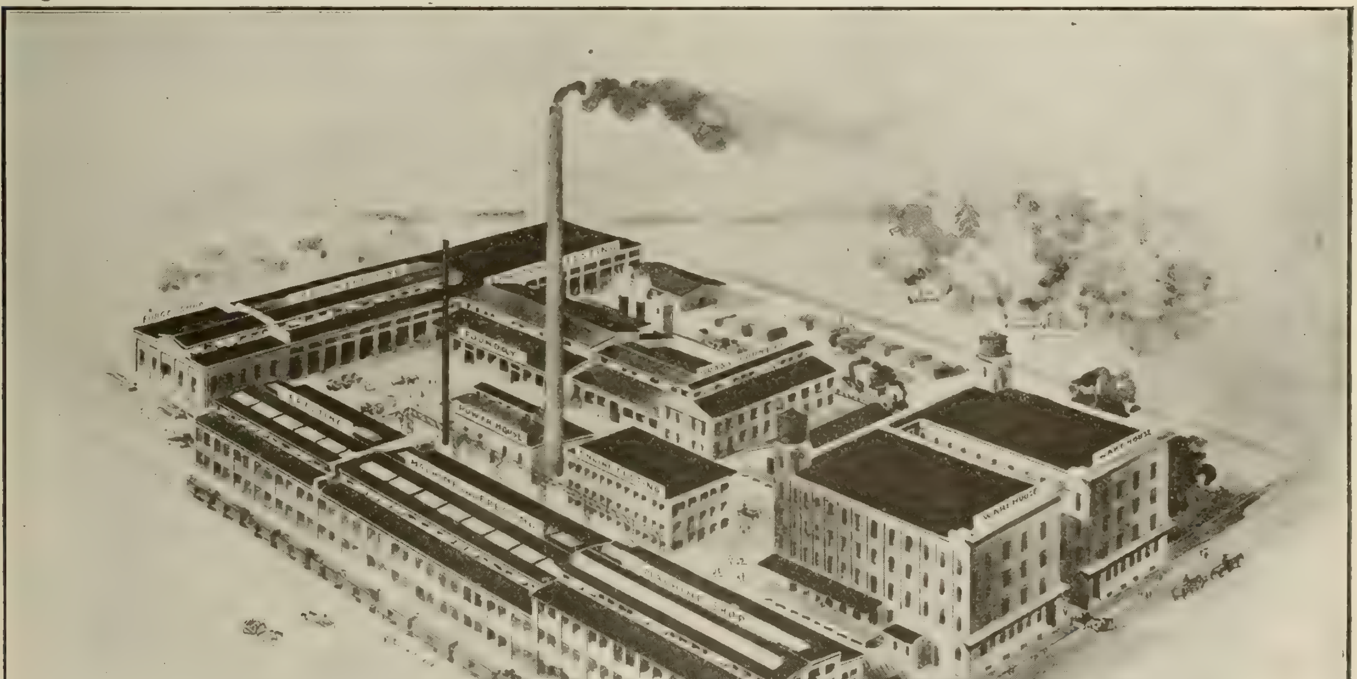
THE Toronto plant, as previously mentioned, was built in 1905, and consisted of a large machine shop, power house and grey iron foundry. All these buildings are of reinforced concrete construction, with concrete columns and roofs. In 1909 a large warehouse building was erected, and in 1912 an extension was made to the foundry, a cleaning room and pattern shop being built and the tractor shop erected. The plant covers an area of 8 acres, and is very conveniently laid out for the expeditious production of the various lines manufactured. These include gas and oil engines for general purposes, marine oil engines, steam pumps, transmission appliances and oil tractors.



NEW WAREHOUSE AND OFFICE BUILDING OF THE CAN. FAIRBANKS-MORSE CO. AT VANCOUVER, B. C.

Buildings' Layout.

A very complete system of industrial tracks has been installed, the tracks being laid through each shop and interconnecting. For the conveyance of materials on this system trucks driven by Canadian Fairbanks oil engines are used. This considerably facilitates the handling of materials. There is in addition a spur from the Grand Trunk Railway running through the yard to



the warehouse building at the north end of the plant, with a branch to the machine shop.

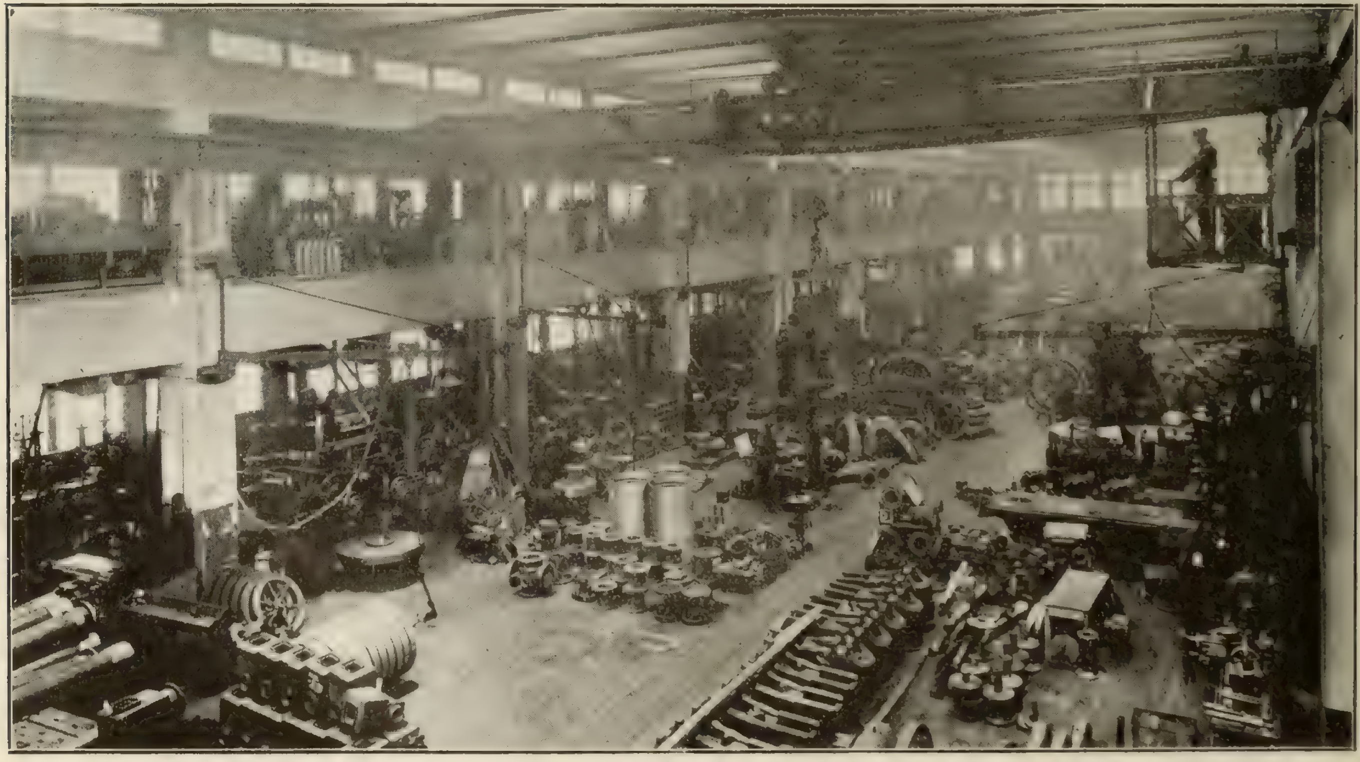
Beginning at the north end of the property, there is the warehouse building, 134 ft. 6 in. x 80 ft, four storeys high, and of substantial mill construction. On the roof is a 30,000 gallon tank for the sprinkler system, and on the west side is the pipe shed, 101 x 52 ft., for storing stand pipe and other castings. This building has shipping platforms on two sides. Beyond is the cleaning room, 103 x 47 ft. 6 in., with a pattern shop and storage above. This building is also of mill construction. Adjoining is the grey iron foundry, 330 ft. 6 in. x 100 ft.; one section being used as a core room, and another section as the brass foundry. The old reinforced concrete building with concrete columns and monitor roof embraces 230 ft. of the total length, while the remaining 100 ft. is accounted for by the new brick extension with steel columns at the south end.

On the east side of the plant is the machine shop, 266 ft. long x 100 ft. wide. This building is of reinforced concrete construction, with concrete columns and roof. The clear height from floor to roof is 30 ft. 6 in., and floor to crane rail 24 ft. The main bay is 51 ft., being exceptionally wide for this type of construction. The gallery floors are 14 ft. above main floor, and there is 12 ft. clear above the galleries. Outside this shop, on the west side, and extending the full length, is a castings storage, over which operates an overhead hand travelling crane, 30 ft. span, and equipped with a 3 ton Yale & Towne electric hoist.

In the centre of the property is the power house, 102 ft x 80 ft., and a test and paint shop, 100 x 71 ft. All these buildings are of reinforced concrete construction. At the south end is the new tractor shop, 397 ft. x 100 ft., built of reinforced concrete and brick. The columns and roof trusses are steel and the wood roof is covered with roofing material. The windows have "Fenestra" steel sash and ribbed glass. The height from the main floor to gallery floor is 19 ft. and to the crane rail 30 ft. In the yard alongside the track is a sand and coke storage, and at the west side the steel storage with fuel oil tanks adjoining. In other parts of the plant are a transformer house, stables and carpenters' shop.

The buildings are all heated by coils around the walls just above the floors, low pressure steam is supplied from the boilers. All the buildings are equipped with a sprinkler system installed to the specification and under the inspection of the Manufacturers' Fire Insure Co., Boston, Mass. The tank for this system is supplied from the city mains, which are also directly connected to the system. A number of hydrants are located at various points as an additional precaution against fire. A concrete tun-

TORONTO PLANT—SECTION OF FOUNDRY.



TORONTO PLANT—MACHINE SHOP (B) INTERIOR.

nel, 6 ft. x 6 ft., connects the power house with the tractor building and carries light and power cables, high and low pressure steam mains and a compressed air line. Under normal conditions of trade about 1,000 men are employed.

T. Pringle & Son, Ltd., factory architects, Montreal, were responsible for the layout and design of the various buildings.

Foundry and Pattern Shop.

The foundry is laid out in three bays, the centre bay being 46 ft. 6 in. wide, and the side bays 26 ft. 9 in. wide. The core room occupies 130 ft. of the west bay, and outside a lean-to has been built to accommodate 8 core ovens; four being fitted with racks and four being car ovens. They are all heated with coke and fitted with Kinnear rolling doors. At the south end of the east bay 100 ft. has been appropriated for a brass and aluminum foundry, in which are four crucible furnaces. North of the brass foundry are the No. 8 and No. 5 "Whiting" cupolas, with Roots blower, driven by a 40 h.p. motor. The charging floor is served by a 7-ton electric hoist operated by a 10 h.p. motor. There is a Fairbanks scale on the charging floor. A 5-ton Niles electric overhead travelling crane is installed in the main bay, also a hand operated travelling crane, with a 2-ton Yale & Towne triplex block. Additional equipment and appliances consist of jolt rammers, Adams squeezers and a Paxson magnetic separator.

At the north end of the foundry is the cleaning room and finished castings storage. In this room are installed tumbling mills, grinders and an overhead runway system, equipped with a 1½-ton Yale & Towne triplex chain block. Castings are carried from the foundry to any part of this room. Above the cleaning room is the pattern shop and pattern storage. The pattern shop is at the east end, and is equipped with 2 Cowan planers, a Gardner grinder, band saw, and a circular saw by the Crescent Machine Co., Leetonia, O. The line shaft is fitted with "Skefko" ball bearings, and is driven by a 20 h.p. motor.

Machine Shop.

The main machine shop has three bays, the centre having a span of 51 ft., over which operates an 8-ton Niles electric crane. There are two rows of roof lights in addition to the side windows. Galleries, 24 ft. 6 in wide, extend along the full length of each bay and along the north end of the main bay, with stairways leading up to each. At the north-west corner of the main floor are the superintendent's office, drawing office and timekeepers' office, while at the north end most of the heavier machine work is done; as a consequence, the majority of the larger machine tools are located there. The principal tools include a 2-spindle horizontal boring machine, by Bearman & Smith Co., Providence, R.I., which is used principally for boring pump cylinders; a Bertram engine lathe for turning crank shafts, and a Niles lathe for the same purpose; a Bertram vertical motor driven boring mill for general purposes, and a Lapointe broaching machine. In the east bay are several Bertram radial drills, a ten spindle multiple drill by Manning, Maxwell & Moore Co., New York, and a Fosdick radial drill. In the centre are two Bertram horizontal boring machines for boring cylinders and pump base castings. Further down are two vertical turret lathes by the Bullard Machine Tool Co., Bridgeport, Conn. In addition to the above mentioned equipment, there are several standard machines for general purposes.

The gallery at the north end is devoted to the manufacture of repair parts and assembling stand pipe valves. Small parts, such as igniters, fuel pumps, reservoirs and small valves are machined and assembled at the north end of the east gallery. Adjoining this department is the grinding and polishing shop, where are several grinding machines by J. G. Blount Co., Everett, Mass., and at the south end is the tool room and tool stores. In this room the usual tool makers' machines are installed, such as Brown & Sharpe and Becker milling machines, a grinding machine by Brown & Sharpe, Bickford drill presses, several Hendey lathes, and a Gould & Eberhardt gear machine. The line shaft is driven

TORONTO PLANT—OIL TRACTOR ERECTING SHOP.

by a 15 h.p. motor. The west gallery is devoted entirely to the storage of finished parts.

Returning to the main floor at the south-east end are several Pratt & Whitney semi-automatic turret lathes, a Pfauter gear hobbing machine, a Hall pipe cutter and a Gisholt turret lathe. Near this department is a Bertram gapped lathe for machining fly wheels. At the south end is the assembling department, where the engines, pumps, etc., are completely finished preparatory to being tested. Testing in the case of the larger engines is done in a separate building, but the smaller sizes and marine engines are tested in this particular shop, the test stands being ranged along the south wall. There are thirteen test stands, to which fuel oil is pumped. In some cases the marine engines are coupled up to a shaft, to which a propeller is connected outside the building and immersed in a tank of water. In other cases, a fan is substituted, revolving in free air. The engines are run at a high speed, and all adjustments made that may be found necessary. Following the test they are ready for painting and shipping.

TORONTO PLANT—FABRICATION SHOP FOR TRACTION ENGINES.

A standard gauge track runs into the machine shop far enough to permit cars being loaded from the assembling floor. Fixed to the columns are a number of jib cranes with ½ ton air hoists. The machines on the ground floor are grouped in sections, each section being driven by separate motors varying from 30 to 40 h.p. In a few cases the tools are driven by individual motors. There are two 2-ton electric freight hoists, supplied by the Kieckhefer Elevator Co., Milwaukee, one serving each gallery midway in the shop. Near the elevator under the gallery on the east side are the tool stores.

Testing and Painting.

The stationary oil engines after being assembled, are taken to the testing shop, which occupies two sections of one building, while the third section constitutes the paint shop. Each section is served throughout its whole length by a hand operated overhead travelling crane equipped with a 3-ton Yale & Towne triplex block. In the test shop, the engines are subjected to a brake test and all necessary adjustments made. Each test-stand has a separate oil fuel supply which is pumped from the oil storage. There is an exhaust connection to the outside on each test stand. In the paint shop the engines are painted and given the finishing touches preparatory to shipping.

Tractor Shop.

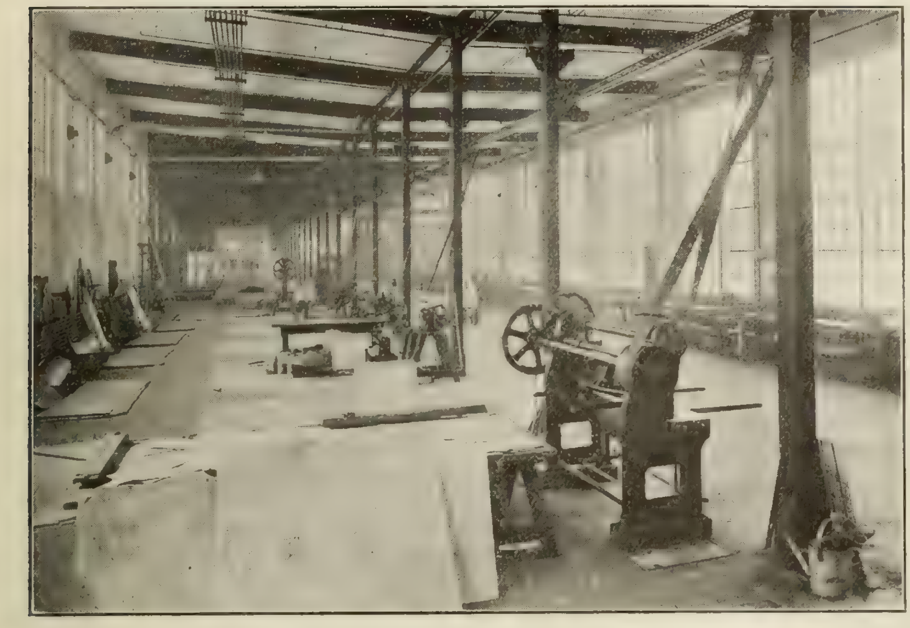
The tractor shop is a new building of modern reinforced concrete and brick construction, 397 ft. x 100 ft. On the north side is a gallery 322 ft. long and 50 feet wide where the galvanized iron cooling water tanks are made for the tractors, etc. The forge shop 100 x 50 feet is located on the south-east end and at the north-west end is the tractor paint shop and storage 75 x 50 feet. Operating over the full length of the main floor is a 12-ton Niles electric crane. Industrial tracks are laid through the forge and on the ground floor under the gallery there are two tracks with turntables at intersecting points. A part of the ground floor under the gallery is devoted to making tractor road wheels. Here the rims are rolled and punched, a Bertram punch and plate rolls being used for these operations. This section is served by a hand operated hand travelling crane equipped with a 3-ton Yale & Towne triplex block, and by two hand cranes with 1-ton Yale & Towne chain blocks.

In the forge shop are 9 smith's fires and 4 oil-fired furnaces, draft being supplied to these by a Roots blower driven by a 15 h.p. motor. Pipes are installed for the air supply to the fires and furnaces, and a blower carries away the smoke from the fires to a steel stack. There are two Bertram steam hammers of 1,200 and 4,000 pounds respectively. There are also an upsetting machine by the Acme Machinery Co., Cleveland, a bulldozer, a Bertram bolt-shear and a Bradley cushioned power trip hammer. At the west end are two case-hardening furnaces. The line shaft is operated by

TORONTO PLANT ERECTING FLOOR, MACHINE SHOP (A).

a 25 h.p. motor, and the blower by a 15 h.p. motor.

For manufacturing tanks in the gallery, there are a Toledo electric welder, a 4 ft. gate shear by the Niagara Machine Tool Co., Buffalo, and circular shears by the same firm. A power press and Keene brake are also installed, two Otis Fensom two-ton electric freight hoists are installed, and a stairway is provided for the employes. There are also two platforms projecting from the gallery over the main floor for use in connection with the travelling crane.



TORONTO PLANT—SHEET METAL DEPT. TRACTOR BUILDING.

Power Plant and Distribution.

Hydro-electric power is used and is stepped down at the transformers from 13,200 to 550 volts. The switchboard was installed by the Canadian Westinghouse Co. It has eleven grey marble panels, two only of which are being used at present. The usual equipment of ammeters, voltmeters and circuit breakers furnishes the different panels.

There is a Canadian Fairbanks 40 k.w. 25-cycle, 3 phase, 750 r.p.m. motor generator set for supplying d.c. current at 220 volts to the crane motors. Power is distributed to the motors in the various shops at 550 volts and 110 volts to the lighting circuit. Canadian Fairbanks Co. motors are installed throughout, and Mazda and Sunbeam 200 watt and 400 watt lamps are used for lighting.

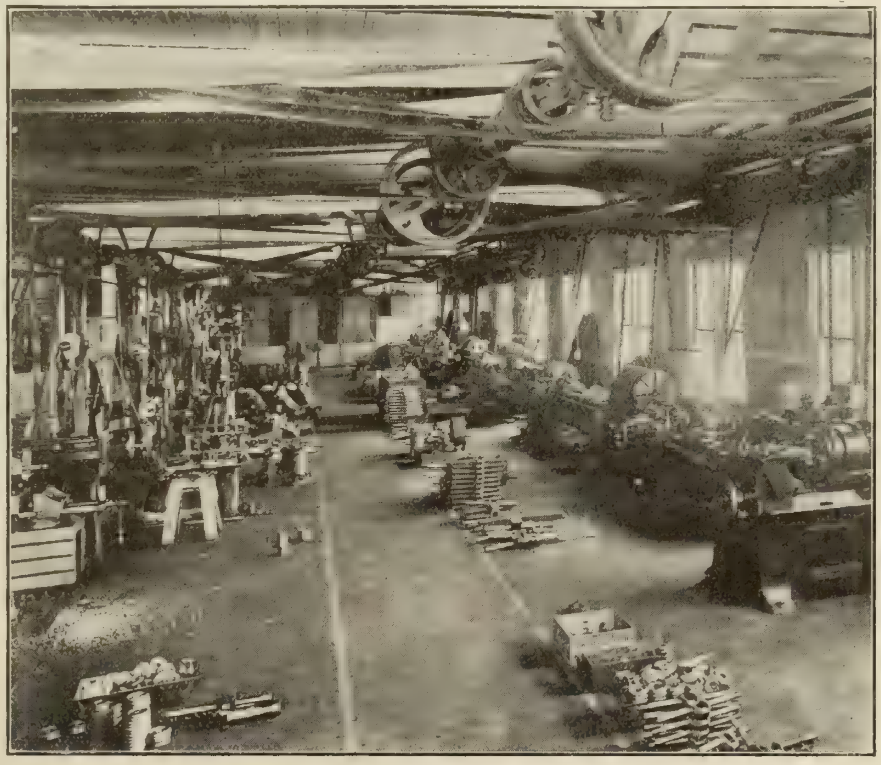
A Canadian Rand air compressor supplies air to the plant. This machine is steam driven, having cross compound steam and air cylinders, the steam cylinders being 11 and 18 in. diameter, and the air cylinders 16 and 9 in. diameter, by 16 in. stroke in both cases. The compressor has a capacity of 744 cub. ft. of free air per minute against a pressure of 100 pounds at a speed of 200 r.p.m. A Canadian Fairbanks 6-8-12 vacuum pump takes the drains from the heating coils and returns them to a Cochrane feed water heater. Two Canadian Fairbanks 6-4-6 boiler feed pumps are also installed.

In the boiler room is a battery of four boilers which consists of one 150 h.p. Babcock & Wilcox water tube boiler having a working pressure of 150 pounds; two Brownell return tubular boilers and one return tubular boiler by the John Inglis & Co. The three latter boilers are of 75 h.p. each, and have a working pressure of 70 pounds. The steel stack is 100 ft. high by 40 in. diameter. At the back of the boiler room is the coal storage.

Marine Engine Department.

The assembly for marine oil engines is on the third floor of the warehouse building, and the machine shop for this department occupies the fourth floor. On the third floor are a number of stands where the engines after being assembled are limbered up which is a kind of preliminary test to see if they have been assembled correctly. The line shaft in connection with these stands is driven by a 15 h.p. motor, and a portable crane is used for handling the various parts. At the end of the shop is a finished parts storage.

The fourth floor is the marine engine department machine shop, and is devoted entirely to the manufacture of this type of engine. In the centre is a crib or store for tools. There are in this shop a number of tools for general purposes, and among others, a Steinle turret-lathe for boring engine cylinders, and a Heald internal grinder for finishing the cylinder bore. The bottoms of cylinder castings are machined on an Ingersoll 2-spindle miller, and helical gears are cut on a gear-machine supplied by the Lees Bradner Co., Cleveland. There are radial drills by Bertram and the Cincinnati Bickford Co., a Brown & Sharpe Universal miller, a Norton

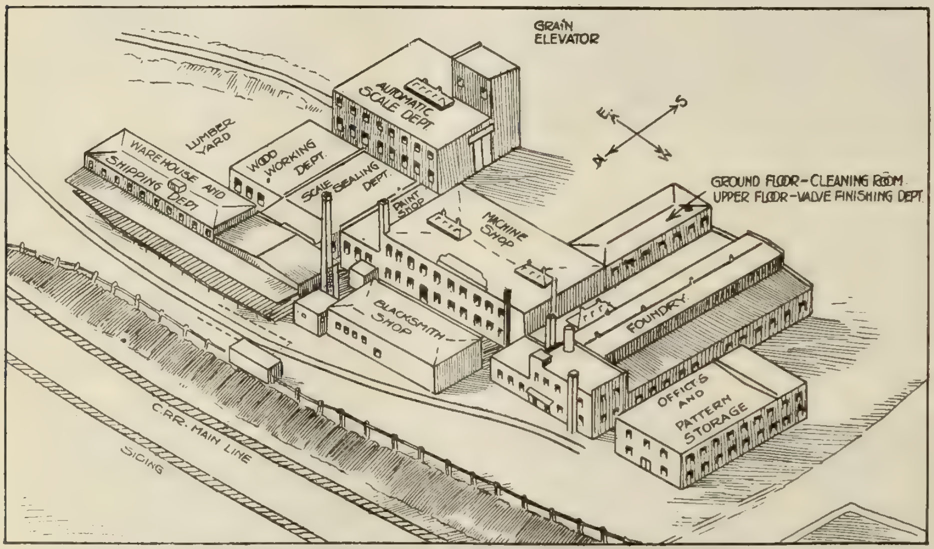


TORONTO PLANT—SECTION OF MARINE ENGINE SHOP.

grinder for finishing crank shafts and a Bertram engine lathe for turning them. The cylinders are drilled at one operation by a 20-spindle multiple drill by the Fox Machine Co., Grand Rapids, Mich. The line shafts are equipped with "Shefko" ball bearings and are driven by three 30 h.p. motors.

Warehouse Building.

The warehouse building is of substantial mill construction, 134 ft. 7 ins. x 80 ft., and four storeys high. The basement is used as a general storage and the first floor is occupied at the north end by the general offices, the remainder constituting the shipping and receiving departments. This floor is well laid out for the purpose. On the west side and inside the building, a standard gauge track is installed being connected to the main spur in the yard. The industrial system also runs into this department and in the same section near the roadway is a platform for teams. An 8-ton Niles overhead electric crane 23-ft. span operates over the tracks and shipping platform and also serves the second floor which is broken to give the crane a clear way. The arrangement makes two floors available for shipping or storing and the goods are handled with the greatest dispatch. Heavy goods are taken care of on the first floor and lighter goods, such as small engines, are stored on the second floor. Two Turnbull electric freight elevators of 2-tons capacity are installed in this building and serve all the floors. All door and elevator well openings have fireproof sliding doors. A sprinkler system is also installed. On the east side, outside, is a shipping platform for teams and at the corner near the roadway is the time office where a time clock, furnished by the International Time Recording Co., Toronto, is installed. Outside the time house is a 20,000 pound capacity Canadian Fairbanks wagon scale.



E. & T. FAIRBANKS CO. PLANT, SHERBROOKE, QUE.

Commercial Cost and Production Accounting Methods.

A somewhat simple though extremely efficient cost and production system is in force at the Toronto plant of the Canadian Fairbanks-Morse Co. The system embraces practically all departments. The accounting methods used embrace within commercial books what is termed tied-in cost and production records. Materials arriving at the plant are charged to various stores accounts and are disbursed from various stores departments upon requisition blanks or shop production orders, and charged to "Work in Process Account." All entries covering amounts of these goods are entered in the aggregate on regular books of account, the balance shown in the books at the end of the month representing the inventory value of such material in the various stores accounts. All materials are placed in racks or bins in the store room except in the case of large pieces which are stored in a place designated for such. All bins are marked with floor section and bin numbers.

In the general office, a stock ledger account is kept of raw materials entering the plant and the disposition of same. Constant recount is obtained during the year of the various materials, and adjustment made in the stock ledger and general account books, thus keeping quantities and values always correct. Each page in the stock ledger bears information concerning the floor, section, and bin number, designating exact location for storage of various materials. The benefit of this system is that materials can be located with the least amount of delay or expense.

Further information obtained from stock ledger sheets includes drawing number, symbol, name of part, product used on, maximum or minimum stock carried, unit value and weight of material, and in the case of machine product, labor cost as well as material cost.

The fiscal year ends on December 31, and on the first of that month, these stock sheets are all listed on an inventory sheet in the same order as carried in the ledgers, being priced and completed except quantity, and leaving blanks for the latter or piece numbers. Thus at the end of the year all that is necessary for inventory figures is to call the number of pieces or quantity shown in hand at Dec. 31st after which there only remains the extensions and totals.

All materials are ordered by the distribution department which has charge of the storage and disbursement of materials on the plant. No accounts are kept on general books with creditors but all accounts are merged into "Accounts Payable." The voucher cheque system of payment is used very successfully. All invoices are listed on the reverse side of voucher cheque, a carbon copy being taken of same. Invoices are rivetted to the carbon copy and voucher cheques credited to "Accounts Payable" and charged to some Plant Asset, material or Burden Account. This entry is taken care of through a voucher register, and the voucher cheques are filed away under due dates. As these various due dates mature, the cheques are taken from the file and entered in cash book being debited to "Accounts Payable" and disbursed to the various individual creditors as shown by the vouchers.

The balance of accounts payable always represent amounts due creditors. This system eliminates individual creditor accounts and automatically informs the treasurer when the accounts are due.

All wages are paid semi-monthly in cash. The wages scheme being a modification of the premium system which uses time for its basis as distinct from money value in piecework. The men on entering and leaving the plant punch the time on time clock cards and in each shop is a rack for holding these cards, numbers on the rack corresponding to those on the cards. The rack is locked by a timekeeper when the whistle blows, and any man who has not his card in place is counted late or absent as the case may be. All distribution of time to cost accounts is cared for by shop timekeeper who distributes time to plant numbers, burden numbers or otherwise. Time cards go to the time office and are checked with clock cards as to total time. The time is extended at various rates and in proportion to the various order numbers, after which it posted to the cost ledger.

Total labor distribution in cost ledgers is balanced with each payroll to the amount of payroll paid out. All labor on production material is charged to "Work in Process, account from cost ledgers. At the completion of each job, sheets in cost ledgers are extracted and posted to a final article cost sheet showing detailed cost of all operations on each piece. The fluctuations of these costs are constantly noted and investigated. This ensures the elimination of losses before they have accumulated to any extent. On these cost cards, the final cost of the complete article being given, the proper burden is apportioned to same and cost credited to work in process account as various goods are completed. Thus the balance in ledger opposite work in process is inventory of unfinished work. As goods are shipped, cost of such goods is credited to inventory and charged to sales account, the billing value being credited to sales account and charged to the customer. The balance of sales account, therefore, at all times represents gross profits.

Following out the above system, the accounting department is able to draw off a monthly balance sheet showing in detail inventory of various raw materials on hand and also of the work in process, finished stock and amount of gross profit obtained from shipments. It is also able to draw up a report showing cost of material taken into shop, cost of product finished, cost of product shipped and considerable other valuable information for the management. Comprehensive exhibits of various burden accounts are carried separate from the main ledgers, showing in detail the amounts expended against 150 different expense accounts. Total of amount shown on this burden exhibit balances with amount shown to debit of one account carried in main ledger and designated burden account. From these burden exhibits, monthly burden rates are established for the various productive departments. All fixed expenses, such as depreciation, taxes and insurance, etc., are cared for by monthly estimate and adjusted at the end of the fiscal year.

Thus, expense or burden is checked very carefully in all its details and losses in that direction eliminated as much as possible at the time they occur.

Where Fairbanks Scales and Valves are Made.

One of the first lines handled in Canada by the Company was the Fairbanks scale manufactured by E. and T. Fairbanks & Co., at St. Johnsbury, Vt. By 1907, the sale of these scales had reached such a large volume that the manufacturers decided to supply the Dominion market from a Canadian factory. Land was consequently purchased at Sherbrooke, Que., and a company organized under the title of E. and T. Fairbanks & Co., Ltd. The entire output of this company is handled by the Canadian Fairbanks-Morse Company.

The Sherbrooke factory is situated on a site of seven acres and at the time of building (1907), was thought to be large enough to take care of the Canadian trade for many years to come. However, it has already proved too small, and during the past year an additional five acres have been purchased, on which new buildings will shortly be erected. As it stands to-day, the plant is twice as large as it was three years ago and still cannot meet the demands made upon it without the assistance of the present company at St. Johnsbury, Vt.

About 200 men are employed, the plant consisting of pattern shop, foundry, scale department and office building. The making of automatic scales was only commenced two years ago, but has already made great strides. The company supplied fourteen of these automatics to the Montreal Harbor Commission No. 2 Elevator, which was fully described in the issue of "Canadian Machinery," dated January 2, 1913. Each of these scales has a capacity of 6,000 lbs., and dumps every 30 seconds. They are the largest automatics ever constructed.

The shops at Sherbrooke are all of heavy mill construction, and are so arranged that the work passes through its various stages in a continuous line from foundry and blacksmith shop to the shipping warehouse. There is, however, an entirely separate department for the manufacture of automatic scales, this work being carried out in a building equipped with its own machine shop, etc., as will be presently described.

The Foundry.

The foundry runs north and south and is 165 feet long by 90 feet wide, divided into three bays. The cupola room stands at the north end of the main bay, and contains a No. 5 Whiting cupola, blast for which is supplied by a No. 9 Sturtevant positive type blower direct connected to a 50 h.p. variable speed motor. In addition to turning out grey iron castings, several moulders are kept constantly at work on brass, gun metal and aluminium castings, there being two pit fires for heating crucibles and doing the necessary mixing of alloys.

The middle bay is of course used for the heavier floor work and is served by a floor operated Niles electric travelling crane of 10 tons capacity. For serving the west bay, in which medium sized work is moulded, there is an overhead monorail runway extending down the

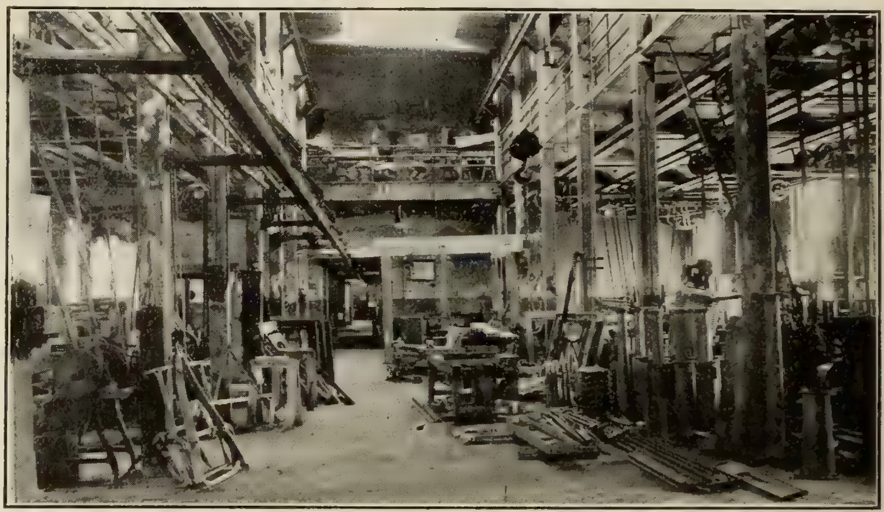
SHERBROOKE FACTORY—WAREHOUSE AND SHIPPING DEPARTMENT.

west side of the main bay below the 10-ton craneway. This runway curves across the north end of the shop in front of the cupola, enabling heavy bull ladles to be easily conveyed down the bay, the metal being poured into hand ladles at any desired point in the west bay.

The north end of the east bay is given over to brass moulding, the chief product being the Fairbanks globe and angle valves. These are moulded on two hand operated drop pattern machines. Of 1-inch valves six are put up at one operation, 75 to 80 moulds being turned out per day on each machine. Brass is melted in a No. 5 Hawley-Schwartz down draft tilting furnace burning crude oil, blast being supplied by a small motor driven blower of the Roots type. The remainder of the east bay is occupied by bench moulders and by a coke-fired drying oven for the dry sand moulds.

The foundry has recently been piped for compressed air and Tabor power squeezers and other moulding machines are about to be installed. Already a large number of flat and comparatively shallow articles are made from aluminum match plates and no means are neglected for reducing costs without sacrifice of efficiency. Thus, all holes for bolts and countersunk screws are cored out to save labor in the machine shop. Even tapping holes as small as ⅜-inch are cored, an oil sand core of course being used.

Scale pivots, or knife edges as they are sometimes termed, are first forged in the blacksmith shop and then sent to the foundry where they are carefully set in the moulds and thus cast into place in their levers. They are forged with a slight taper in their length to enable them to be driven out in the cleaning room for the purpose of hardening and grinding. When being forged they are heated in an oil furnace to avoid the formation of scale, and before being placed in the mould they are dipped in coal oil for the same purpose. If scale were allowed to form on them it would be practically impossible to drive them out of their levers for hardening, etc.



SHERBROOKE FACTORY—INTERIOR OF MACHINE SHOP.

The core room is located to the east of the cupola room and gives employment to several men and women. It is equipped with a Hammer core machine and Millett drawer oven. The employment of women for core-making is perhaps not so common an occurrence in this country as it is in the United States. It is an employment well suited to a woman's deft fingers, however, and the Fairbanks Company receive many more applications from girls for employment on this class of work than they are able to entertain.

The Cleaning Room.

The cleaning department has recently been rebuilt and reorganized, and is now thoroughly up-to-date in every way. In

SHERBROOKE FACTORY—EXTERIOR OF MACHINE SHOP.

This photograph was taken previous to the erection of the blacksmith shop, the foundations for which are seen in the foreground.

fact it is one of the best features of the factory, being run on very interesting lines. It lies to the east of the foundry and is quite distinct from that department, having a separate foreman. The equipment includes a sprue cutter and three Sly exhaust tumblers, one being 20 in. x 48 in., one 22 in. x 84 in., and the third 32 in x 44 in. Castings which one would think it practically impossible to clean by tumbling are here satisfactorily treated. Intricate pieces with light lugs cast on are successfully tumbled, the finish thus secured being very much superior to anything that can be obtained by the scratch brush method. In the illustration of the machine shop, a triangular cast iron lever may be seen leaning against one of the shop columns to the left of the picture. This is a specimen of work that is cleaned by tumbling. Of course the tumbler barrels are not carelessly filled with a promiscuous collection of castings, but are carefully packed with a number of pieces all of one class. By this means very satisfactory results are obtained, the occasional very small loss of money due to broken castings being as nothing compared with the greatly reduced cost of cleaning.

In the middle of the cleaning room is a wood-lined sand blasting chamber, containing a Sly sand blast outfit. The sand and dirt fall through a large floor grating into a pit, whence an exhaust fan draws them into a separator chamber on the roof. From here the sand is separated from the dirt and returned to the tank. The exhaust piping from the three tumbler mills discharges to a dust arrester, the sand gravitating to a hopper having an outlet outside the cleaning room. The parting sand being heavier than the facing sand naturally gravitates to the bottom of the dust arrester, consequently when the discharge gate of the hopper is opened, the parting sand makes its exit first and is caught in a receptacle for use again. The facing sand follows, and is thrown away. It is easy to tell by the appearance of the discharge when the facing sand begins to make its appearance.

Checking Castings.

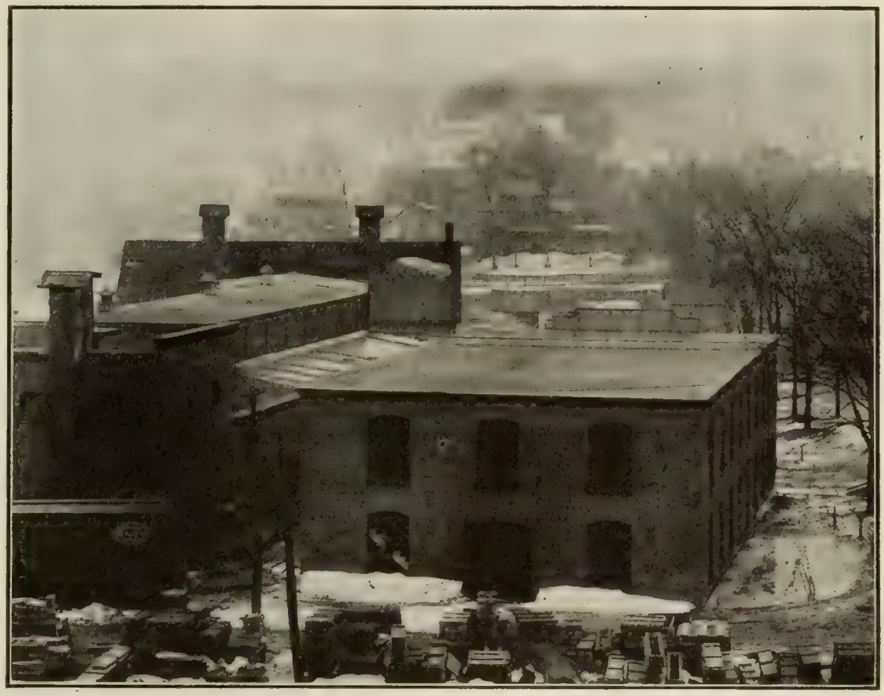
Although a very large number of castings of all kinds and sizes are always passing through the factory in various stages of progress, the office can check up the number each day by a system of reports that has been established. When an order is received for (say) 100 scales of a certain standard pattern, the office issues an order on the foundry for the necessary number of castings. These, the foundry delivers in lots each day to the cleaning room, and sends in a daily report to the office of the number of castings made. The office sends a list next day to the foreman of the cleaning room of the casting reported as having been delivered to him the previous day. He inspects the work and gives a report as to the number and weight of the good and bad castings respectively. The office is thus kept informed of just what is turned out, and can keep track of the shrinkage.

The cleaning room delivers the good castings to the various departments such as machine shop, stock room, or automatic scale department, and gets a receipt for same. The receipt is made in triplicate, one copy being retained by the department accepting delivery of the castings, one being handed to the cleaning room and the third being sent to the office. In this way the office knows exactly the number and weight of castings passing through the factory at any time. Similarly, as castings are machined, they are passed to another department, the foreman of which gives a receipt for them, thus enabling the office to keep track of the progress of work on each lot.

Machine Shop.

The machine shop, paint shop, scale sealing department and wood working department lie contiguous to one another in a line at right angles to the foundry. The machine shop is admirably equipped with thoroughly modern tools arranged in the side bays. The illustration fails to do it justice, it being an awkward shop to photograph satisfactorily. It is 100 feet by 60 feet wide, and is divided into three bays of 20 feet each. The centre bay is equipped with a 7½ ton Niles electric traveller operated from the floor, and in addition there is a monorail runway by which castings are brought from the cleaning room. This runway extends the full length of the shop, and continues on through the paint shop sealing department, and woodworking shop. It then takes a turn to the south, and finally terminates in the automatic scale shop.

At the head of the machine shop a space has been partitioned off to form a compressor room. In it is a Canadian Ingersoll-Rand two stage, centre crank air compressor of 320 cubic feet capacity, belt driven by a 50 h.p. motor. The work done in this shop includes machining of parts for all sizes and types of scales except automatics. Scales of 500 lbs. capacity and up are built on the ground floor, lighter scales being put together in the galleries, of which there is one over each side bay. These galleries also do the beam work, poises, sheet brass work, etc.



SHERBROOKE FACTORY—OFFICE AND PATTERN STORAGE BUILDING WITH FOUNDRY

The machines in the side bays on the ground floor are belt driven, the shafting running in Skefko ball bearing hangers. An interesting machine is one patented by E. & T. Fairbanks & Co. On it the pivot edges are milled to gauge, thus doing away with the old method of hand filing. Other fine tools here are a 24-inch Potter & Johnston shaper, No. 2B Milwaukee universal milling machine, and several Flather lathes. There is also a full equipment of drill presses. Steel bearings are ground on an automatic grinder made by the Diamond Machine Co., Providence, R.I.

In addition to the work already mentioned, polishing, buffing and plating are done on the galleries. The tool room is also located there. On the same level as the south gallery and leading out from it is the valve shop. This is located above the cleaning room, and is a new department, having only gone into operation in June last. Here the Fairbanks globe and angle valves are machined, assembled and tested. Along one side of the shop are ranged eight turret lathes and three 2-spindle millers, all by Warner & Swasey. On the other side is the test bench, where all the valves receive a hydraulic test of 300 lbs. per square inch. From the test bench they are placed on a truck and removed in batches to the packing benches. It will thus be seen that there is no lost motion whatever, the castings on entering the shop passing down the line of turret lathes on one side and returning up the other side to the testing and packing benches.

SHERBROOKE FACTORY—MAIN BAY OF FOUNDRY, LOOKING NORTH.

The Blacksmith Shop.

The blacksmith shop runs parallel with the machine shop, and contains six Buffalo down draft forges and four Dupont hammers. There is also a bolt machine for forging bolts up to 1¼ inches diameter, this being served by a rotating rod heating furnace. The west end of the shop is occupied by an extensive iron rack, with shears situated conveniently near by. The scale pivots are all forged here, and after being cast in place in the levers are driven out and brought back to this department for hardening.

The Paint Shop.

This is a two-storey building, located between the machine shop and the sealing department. Small work is here dipped in Japan and baked, there being two baking ovens, 6 ft. x 14 ft. These will each accommodate two cars 4 ft. x 6 ft. Large work is brush painted, all this being done on the ground floor. The finer work, such as sign painting, enamelling and varnishing, is done on the upper floor.

Sealing Department and Packing Room.

The scale sealing department is one of the most important in the plant. Here the scales are assembled and carefully adjusted for accuracy and sensitiveness. Every scale is tested against standard weights, and has to pass a Government inspection before leaving the factory.

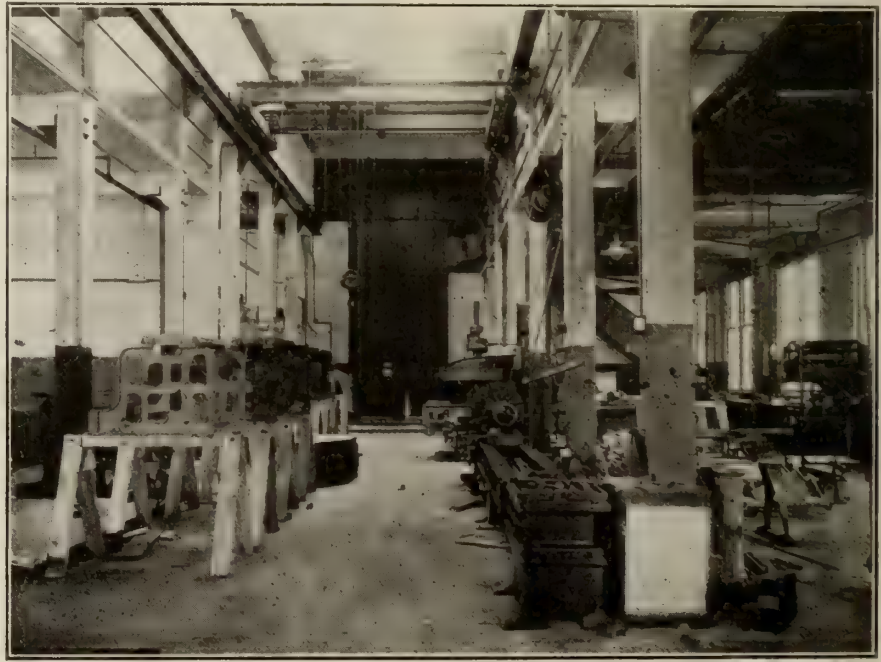
Scale adjusting, or "sealing" as it is technically called, is work that calls for a great deal of patience, together with a high degree of conscientiousness, on the part of the workman. A man of a nervous temperament, who, to use a slang term, gets easily "rattled," is useless on this class of work. Of two exactly similar scales one may perhaps be accurately adjusted in a couple of hours, while the other may occupy a man's time for four or five days before it is finally made sufficiently sensitive and accurate to comply with the high standard set by the Fairbanks Company.

Part of this shop is used as a packing department, the scales being here packed and crated before passing to the warehouse which lies alongside.

Woodworking Department.

Next to the sealing room comes the woodworking department, which is equipped with the usual band saws, surfaces, etc. Here are made beam cupboards, wood scale frames, wood platforms and similar carpenter work. Because of the factory standing on a site with a decided slope to the east, advantage has been taken of this feature to provide roomy basements below the woodworking and sealing departments, and also under the automatic scale shop. In the woodworking basement, further machinery has been installed, packing cases, crates and foundry flasks being made here and afterwards raised to the upper floor on an elevator. Here, too, are located two steam heated dry kilns. The space below the sealing room floor is used for storage of stock parts, of which there is always a large number on hand. The automatic shop basement is used for a similar purpose.

Below the warehouse there is also a basement in which are two 60 in. x 144



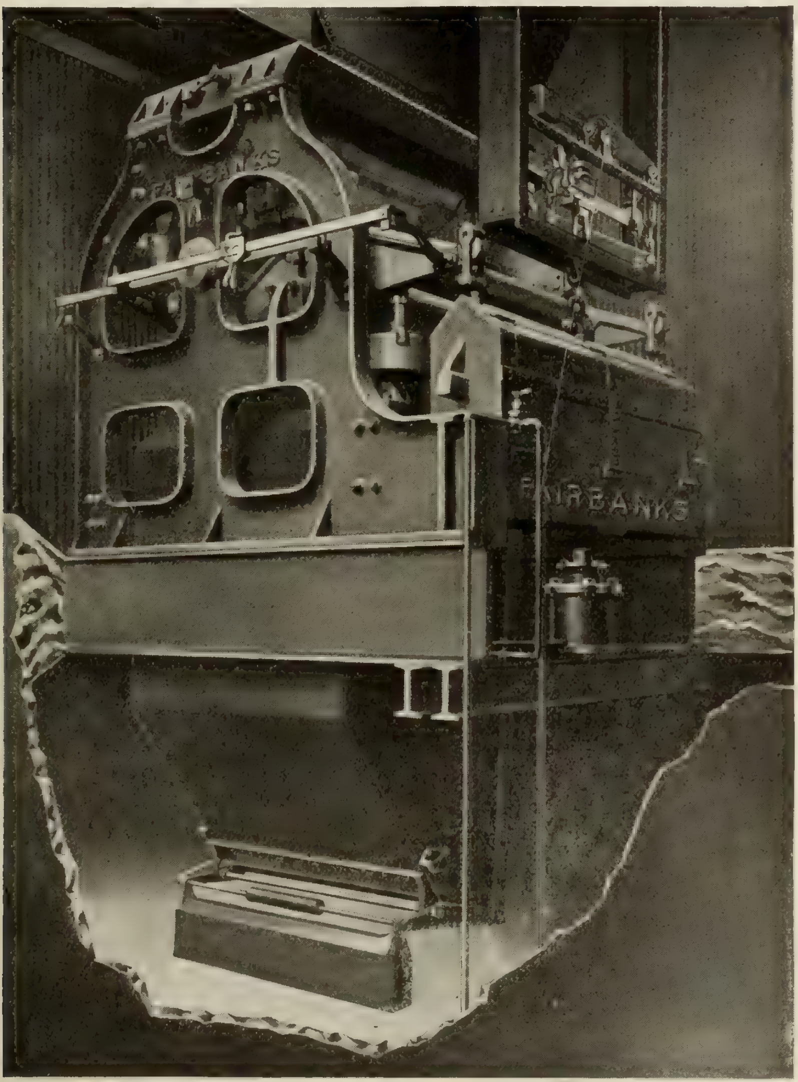
SHERBROOKE FACTORY—INTERIOR OF AUTOMATIC SCALE DEPARTMENT in. return tubular boilers built by the Jenckes Machine Co., Ltd. These supply steam for the heating system, all buildings being heated by direct radiation. Power for operating the factory is purchased from the Sherbrooke Municipal Hydro-Electric system.

The Automatic Scale Shop.

Automatic scales are largely used for weighing grain, peas, rice, coal, sand, cement, ore, etc., in large quantities. They may be made to work continuously or for sacking purposes. In the latter case, the working is controlled by a foot lever, and the machine is usually mounted on wheels to enable it to be run to any position.

The construction of the machine is roughly as follows:—At one end of two parallel weighing levers is suspended a weighing hopper, with a dumping door in the bottom. At the other end of the levers is a receptacle in which counterpoise weights are placed. Above the weighing hopper there is supported on the frame of the machine a feed hopper, into which the material being weighed is discharged from the storage bins. The counterpoise weights transmit their force to an admission gate at the mouth of the feed hopper. On a certain joint being automatically broken, this admission gate is opened, and the grain, or other material, falls into the weighing hopper. When the weight in the latter corresponds to that of the counterpoise, the supply of grain is automatically cut off and the contents of the weighing hopper are automatically dumped. The counterpoise then returns the scale to its original position, and the operation is repeated.

The Company make these scales in capacities from 15 pounds up to 6,000 pounds per dump. They are now engaged in getting out a new design, which they think will eliminate the defects that have hitherto been found in this type of scale.



Fairbanks Automatic Scale supplied to Montreal Harbor Commissioners' Terminal Elevator, No. 2. The scale has a weighing capacity of 10,000 bushels per hour and is designed to dump 6,000 lbs. of grain per dump, two dumps per minute.

The shop in which the automatics are made is a self-contained department, quite independent of the rest of the factory. It is 80 feet long by 70 feet wide, divided into three bays, with two galleries. The centre bay has a 10-ton Niles electric traveller, operated from the floor. The machine tools in this shop include, among others, a 42-inch x 14 ft. Detrick & Harvey open side planer, one 24-inch and two 12-inch engine lathes, sensitive drills, etc.

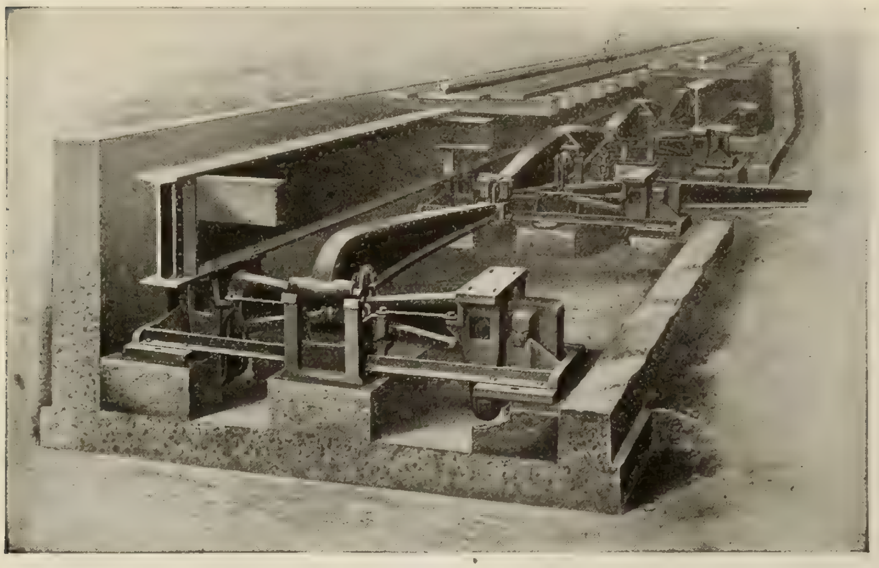
For testing out the automatic scales there is a grain elevator in one corner of the shop. It has a capacity of 6 tons per minute, and is divided into five bins, in order that different varieties of grain may be put through the scales. As the grain is dumped from the weighing hopper it falls through a grating in the floor to be again raised to the bins by steel buckets attached to an endless belt in the usual manner. In the illustration of this department, a number of frames for automatic scales are seen upon trestles in the centre bay. Of the two galleries in this shop, one is used for storage purposes, and the other forms a pattern shop.

Offices and Pattern Storage.

Patterns are stored in a building convenient to the foundry, and are indexed for ready identification. The building also accommodates the offices for the manager and for the timekeeping and accounting staffs. These are on the ground floor, the upper floor being occupied by the engineering department.

For fire protection there is a 50,000 steel tank, 75 feet above ground level at its base. This is fed by city pressure, and is connected to the sprinkler system throughout the factory. The city main is also coupled up to the sprinkler system, there being a check valve on this line and also on the line from the 50,000 gallon tank. Thus, if the city pressure equals a head of water higher than the tank, the water in the latter is held back, and vice versa.

All types and sizes of scales are turned out from this factory from a delicate chemist's balance up to large railway track scales of 200 tons capacity. These track scales are constructed in two styles—pit pattern and suspension pattern, the former being most commonly met with. A pit type track scale of 200 tons capacity is here illustrated, part of the pit walls and the platform being removed to show the levers. The total length of the platform of this scale is 67 ft. 4 in., and it was designed for weighing cars while travelling over the scale at five miles per hour. The main levers are so designed that the bearings are in contact with the pivots throughout their entire length, so that the load on the pivot per lineal inch is even less than on many lighter scales. The platform is suspended from the main levers by links to enable it to swing freely in all directions, thus reducing the wear on the pivot edges. An interesting feature of the design is that no nuts, bolts or rivets are used in assembling the suspension bearing, and by jacking up the platform the working parts can be taken apart without the use of a wrench.



FAIRBANKS 200-TON PIT-TYPE RAILWAY TRACK SCALE.

The suspension type of railway track scale is intended for situations in low wet ground, where the bearings of a pit scale would be liable to rapid deterioration from moisture and dirt.

In this type a structural steel framework is erected around and outside of the platform of a sufficient height to admit box cars and locomotives. The levers are arranged on top of this structure, i.e., 18 ft. or 20 ft. above rail level, and the weight on the platform is hung from the suspension levers by vertical rods. The levers are protected by a light roof, or the whole structure may be covered in. Instead of being of steel, the frame-work is sometimes built in concrete.

The Factory at Farnham, Que.

The Dominion Safe and Vault Co., Ltd., at Farnham, Que, is another Company which is affiliated with the Canadian Fairbanks-Morse Co., Mr. Fuller being its president. This plant covers approximately $5\frac{1}{2}$ acres, of which area considerably more than 60,000 square feet is roofed in. The product consists of fire and burglar-proof safes and vaults, Tattersalls' midget flour milling plant, wood split pulleys, etc., all built to jigs and templates, so that parts will be interchangeable, the tools for this purpose being exceptionally complete.

The buildings proper consist of safe and vault shop, 200 ft. by 75 ft.; flour mill and pulley shop, 180 ft. by 75 ft.; woodworking department, 125 ft. by 75 ft.; and paint shop, 150 ft. by 50 ft. All are of brick construction, well lighted and ventilated. In addition to these there are several buildings for the storage of raw material, each department having its own storage in the immediate vicinity.

The tool equipment throughout is thoroughly modern, consisting of representative machines of each particular type. The group system of driving is followed, each group being arranged to give maximum efficiency. Power is furnished by five A. C. motors aggregating 107 horse-power. An auxiliary steam plant is kept in readiness in case of failure of the electrical supply. The latter is purchased from the Yamaska River Power Station.

The annual capacity of the plant is 1,500 safes or vaults, 40 flour mills and 15,000 to 20,000 wood split pulleys, making an aggregate output approximating eighty carloads per year. Excellent shipping facilities are afforded by both the Canadian Pacific and the Grand Trunk Railways.

Midget Flour Mill Product.

Another important product of the Farnham factory is the Midget flour mill, of which there are over 200 installed in Canada, besides large numbers in Europe and other quarters of the world. Before the introduction of roller milling, small communities were supplied with flour by small stone mills scattered thronughout the country. With the demand for roller made flour ever increasing, these stone mills were gradually reduced to grinding feed, or fell into disuse altogether. With the advent of the small self-contained roller mill, such as the Midget, many small millers have been enabled to profitably resume operations and turn out a flour of far better quality than before.

The Midget mill will grind $4\frac{1}{4}$ to $4\frac{1}{2}$ bushels of winter wheat per hour, or $4\frac{1}{2}$ to 5 bushels of spring wheat. The floor space occupied by the entire outfit is only 8 ft. 6 in. by 4 feet, and its weight 3 tons. The power required to drive it varies from 3 to 4 h.p., according to the class of wheat being milled.

The roller section of the mill consists of two pairs of fluted break rollers and two pairs of smooth reduction rollers; all rollers are 5 inches in diameter and 14 inches long. The movable roller of the pair is in each case adjusted by an arrangement which makes it impossible for the rollers when once adjusted to get out of parallel. After numerous experiments, a special grooving for the break rolls has been perfected which, while thoroughly cleaning the bran, keeps it broad and preserves the inside of the grain pure from branny particles, so that there is no need for the middlings to be further purified below being reduced to flour on the smooth rolls. After each rolling, the stock is carried to the dressing section of the machine, where the flour is sifted from it; the middlings being conveyed back to the next pair of rollers.

The flour section of the mill consists of four centrifugal flour dressers, each 3 feet 6 inches long and 14 inches in diameter. These dress out the flour after rolling, drop the bran and shorts into separate sacks, and return the middlings to be re-rolled.

It will be seen that all the processes of a large roller mill are performed by the Midget mill, although, of course, on a much smaller scale.

General Observations.

In addition to the three factories above described, the Canadian Fairbanks-Morse Company have the Canadian agency for many leading American manufacturers, and are also selling agents for several prominent Canadian firms, such as the John Bertram & Sons, Co., Ltd., Dundas, Ont., and the R. McDougall Co., Ltd., Galt, Ont. The machine tool department is one of the most important handled by the Company, the business done by it amounting to a very large sum yearly.

The men under whose guidance the Company has reached its present prominent position among Canadian mercantile and manufacturing concerns are: Henry J. Fuller, president; Thos. McMillan, vice-president and secretary; C. Graham Drinkwater, vice-president; Percy G. Brooks, vice-president; Edward R. Whitehead, treasurer.

New Plant of Marsh & Henthorn, Limited

BELLVILLE, ONT.

STAFF ARTICLE

This well-known firm have recently completed an entirely new plant for turning out their line of hoisting engines, etc. As will be gathered from the following description and illustrations, it is an excellent example of the modern shops, which are now being erected all over the country by many of our smaller engineering concerns.

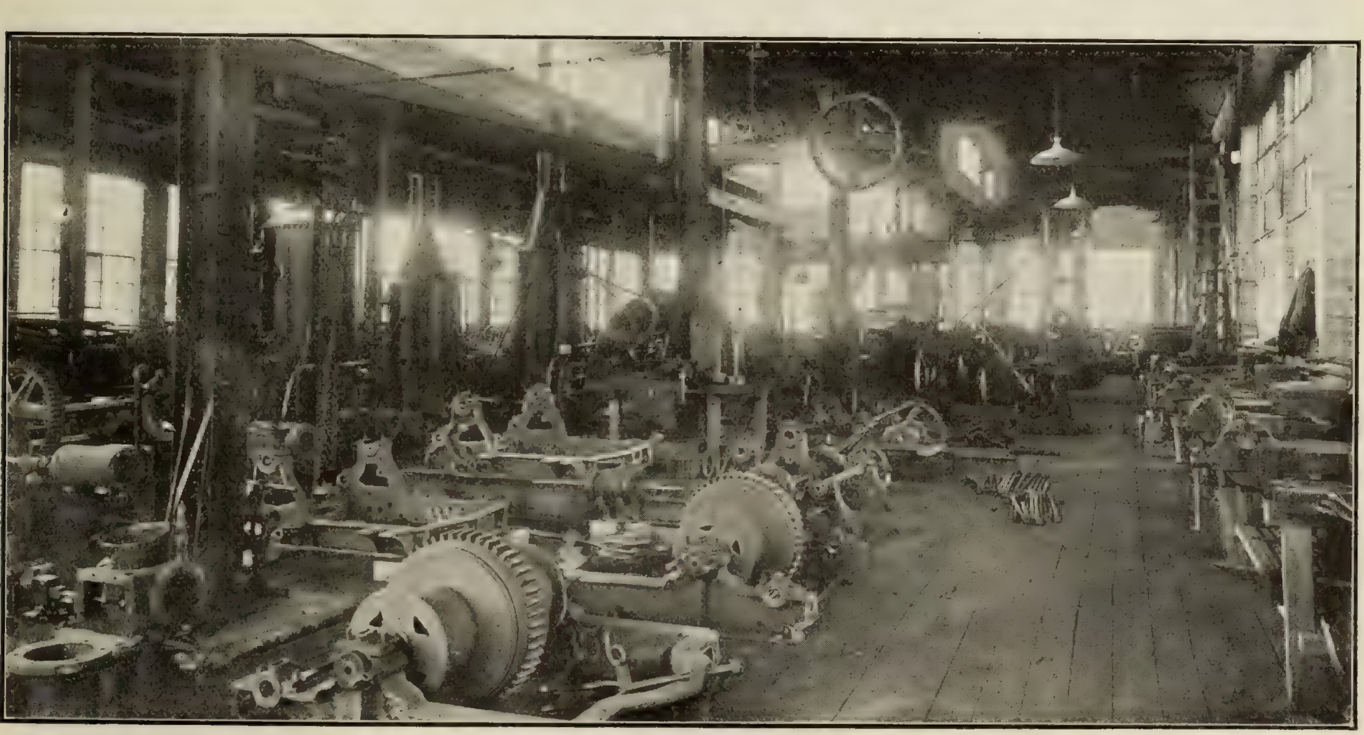
THE business now being so successfully conducted by the firm of Marsh & Henthorn, Ltd., was established at Belleville, Ont. in the year 1846 and has been run ever since without a break, though under several different managements. The present owners are widely and favorably known as manufacturers of hoisting machinery, contractors' supplies, boilers, etc., but originally the output consisted of ploughs, mowers, and others farming implements. Later, the manufacture of stoves was taken up, and at one time all the Babcock & Wilcox boilers used in Canada were built here.

When Messrs. Marsh & Henthorn acquired the business in the year 1897 they decided that the wisest course would be to concentrate on one particular line of work, and the stove and farm implement business was gradually dropped. The building of Babcock & Wilcox boilers was also discontinued and the firm devoted their entire energies to developing a first-class line of hoisting machinery. This special product of theirs is now to be met with in very many mining and lumber camps throughout the Dominion, and is also a general favorite with the leading contractors of the country.

The success attending the efforts of the firm to supply a thoroughly reliable hoist at a reasonable price soon met with gratifying success, and the old premises on Mill street grew more and more congested and unsuitable to the needs of the rapidly growing concern. It was, therefore, decided to build a new and up-to-date plant, and for this purpose a site of 9 acres was secured on the north side of the Bay of Quinte, a short distance to the east of the Steel Company of Canada rolling mills. The buildings were finally completed early in the spring of this year, since when the plant has been in active operation, with a greatly increased productive capacity as compared with the old factory.

General Layout.

As may be seen from the plan, the new shops are well laid out to facilitate inter-communication between departments, while at the same time allowing ample space for future extensions. The site is adjacent to the main lines of the Canadian Pacific and Canadian Northern Railways, a spur from the latter traversing the property and serving the foun-



VIEW SHOWING ERECTING BAY IN MACHINE SHOP.

dry storage bins, erecting shops and boiler shop.

All the buildings are of heavy mill construction, with steel roof trusses. Good natural lighting is afforded by large windows fitted with Fenestra steel sash, while artificial illumination is by tungsten lamps of various sizes, as will be mentioned more particularly later. The shops are electrically operated, 3-phase current at 220 volts, 60 cycles being purchased from the Trenton Electric & Water Company. Each building is heated by direct radiation on the Webster system, the installation having been put in by the Marsh & Henthorn Company themselves.

Pattern Shop and Storage.

The pattern shop is a one-storey building, measuring 60 ft. by 40 ft., and provides accommodation for six or seven men. The equipment is of a standard character and includes ripping and crosscut saws, band saw fitted with tilting table, 12-inch planer, borer, turning lathe, trimmer, etc. Artificial lighting is by 60-watt tungsten drop lights fitted with holophane reflectors.

The firm's product consisting as it does chiefly of their own standard hoisting engines, it follows that the number of new patterns to be made is not large, hence three or four men suffice to keep in repair the large number of standard part patterns and to produce the few new patterns as may be called for from time to time.

The pattern storage is a two-storey building of the same area as the pattern shop. It is of absolutely fire proof construction with floors and roof of reinforced concrete. Access from the pattern shop is by regulation sliding fire doors. The ground floor is used for the storage of the larger patterns, while the smaller are stored upstairs on shelves, and so arranged that they may be quickly located by means of a card index system.

The Foundry.

The foundry is engaged solely in producing grey iron castings, the firm buying the few brass castings they use from outside sources. The building measures 90 ft. by 40 ft., there being a lean-to measuring 72 ft. by 27 ft. to accommodate the storage bins. The latter, as previously mentioned, are directly served by the yard trackage system, enabling sand, coke, pig, etc., to be unloaded direct from car to bin.

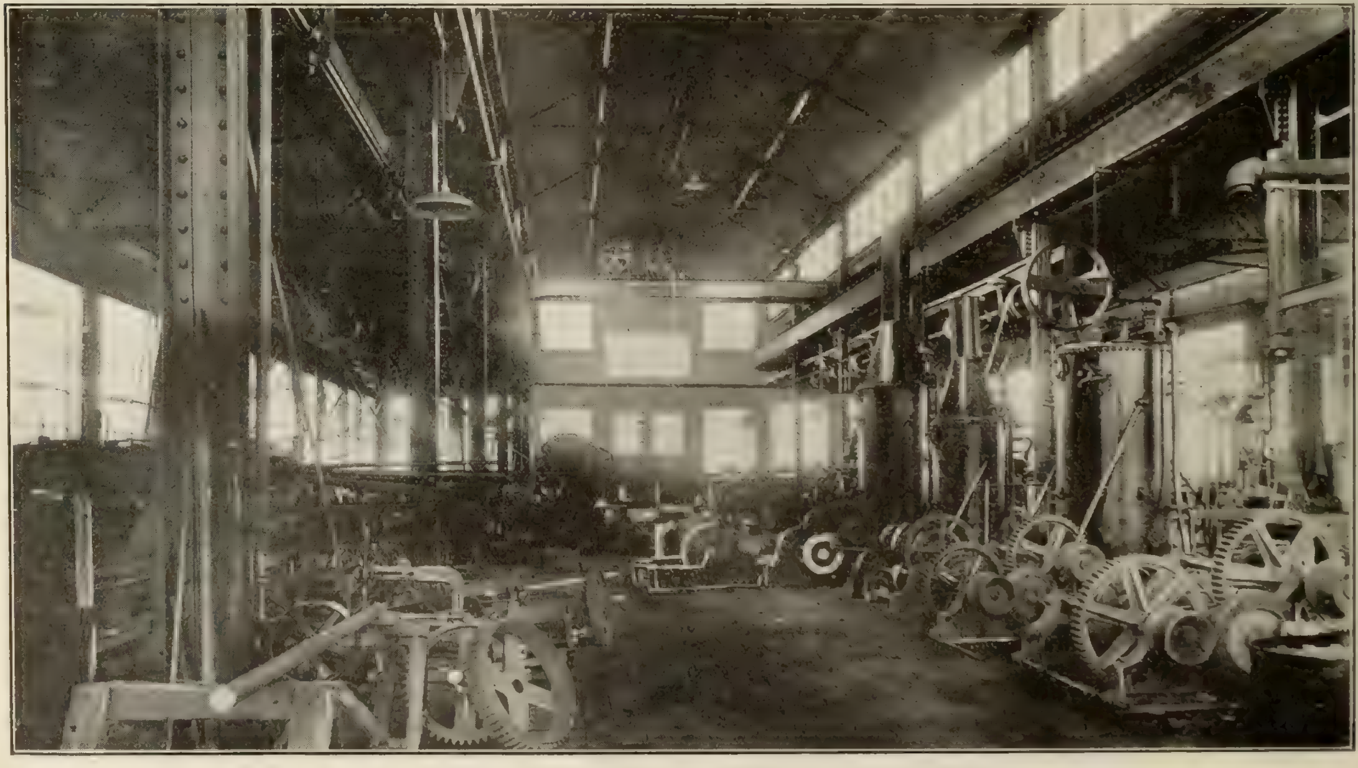
LAYOUT OF THE MARSH & HENTHORN PLANT.

The cupola is a No. 3½ Whiting, of standard construction. Blast is provided by a Buffalo Forge Co. No. 6 Noiseless Blower, which is belt driven by a Canadian General Electric 15 h.p. induction motor. Pig, scrap, etc., are raised by the usual elevator to the charging plat-



VIEW LOOKING DOWN CENTRE OF MACHINE SHOP.

form and are there weighed on a portable platform scale.

All moulds are made in green sand and when business is brisk about 15 moulders are employed in this department. An industrial track connects with the machine shop, a 5-ton jib crane in the foundry being used to place the heavier castings upon the trucks. This crane also serves to convey the heavy bull ladles from cupola to moulds. The cleaning department is located in a lean-to outside the foundry and is equipped with the usual tumbler, double emery grinder, etc. A sand blast outfit will be installed in the near future.

When the growth of the business demands it, this foundry could readily be enlarged to twice its present length and the cupola would still be within convenient distance of the far end of the building.

Machine and Erecting Shop.

The machine and erecting shop is centrally situated between the foundry and the blacksmith shop. It measures 140 ft. by 66 ft., and is divided longitudinally into three bays. The excellent natural lighting is a noteworthy feature of this section. Large window areas in all four walls, together with side lights extending the full length of the monitor roof, make this a shop that would be indeed hard to surpass as far as lighting is concerned. The result, as may be seen from the illustration of this department, is a bright, cheerful shop in which it must be a pleasure to work. Artificial lighting is by 500 watt tungsten lamps down the centre bay, in addition to which there are 100-watt lamps suspended from the crane runway between the columns. The side bays are also lighted by 100-watt lamps. This shop has a 3-inch plank floor laid on cedar ties bedded in cinders.

The centre bay is 28 feet wide and is served by a 10-ton hand operated crane built by John T. Hepburn, Toronto. Besides being used in the erection work, which is done in this bay, the crane serves the heavy lathes. The side bays are each 19 ft. wide and are occupied by the lighter tools, fitters' benches, etc. Testing, painting, etc., are done at the lower end of the shop, and there the finished hoists are loaded on to flat cars which enter the shop on the standard gauge track seen in the plan. The track entrances to this shop, and also to the boiler shop, are closed with Kinnear steel roller doors.

Some of the high-class equipment to be found in the machine shop include engine lathes by Dean, Smith & Grace; a shafting lathe taking 20 ft. between centres by the same makers; a 20-inch—50-inch gap lathe by Redman, Halifax, Eng.; Fosdick 48-inch radial drill of the latest type; No. 3 LeBlond universal milling machine; Mitts and Merrill keyseater, Redman planer, 36-in. x 36-in. x 12-ft.; 24-in. shaper and 24-in. x 24-in. x 6 ft. planer by the Canada Machinery Corporation. There are also many other lathes, drill presses, emery grinders, etc. Jib cranes, fitted with chain blocks, are attached to the shop columns at points convenient to the heavier machines. The transmission equipment is all of Dodge make, the main line shafts being 2 7-16 inches diameter. These run in 18-inch self-oiling hangers and are mounted with split wood pulleys. Adjacent to the machine shop is the general store and tool room. Here, small tools are given out on check, and the numerous jigs and fixtures are kept when not in use.

Blacksmith and Boiler Shops.

The blacksmith shop is 60 ft. x 35 ft., and has the usual cinder floor. A skylight in the flat roof supplements the windows. The work done here is not of a heavy character; so that a single 800-lb. Bertram hammer suffices for the needs of the shop. This hammer is operated by compressed air and is served by a light wall crane.

There is a handy combination punch and shear by F. Pratt & Co., Halifax, England. This is not a double-ended machine but has the punch set below the shear, so that the two throats form the shape of the figure "3." For a small shop, where both punch and shear are not likely to be wanted at the same time this makes a very handy arrangement and results in a considerable saving of floor space. There are four forges, blast for which is delivered by a 20-inch blower driven by the same motor that operates the punch and shear.

The boiler shop is adjacent to the

SECTION OF BOILER SHOP.

blacksmith department and has two bays 28 ft. and 27 ft. wide respectively, by 120 ft. long. The floor is of well tamped cinders. The wider bay is served by an 8-ton Hepburn travelling crane of similar design to that in the machine shop. The head room below the crane is 19 feet. This bay is devoted to plate rolling and flanging, boilersmith work, assembling and riveting; while the other bay is used chiefly for marking off, drilling and punching. In this bay is located a two-stage belt driven $14\frac{1}{2}$-9-8 Clayton air compressor, built by the International Steam Pump Co., New York. It has a capacity of 310 cubic feet of free air per minute against a pressure of 100 lbs. and is driven by a Canadian General Electric induction motor of 50 h.p.

SECTION OF FOUNDRY.

The riveting tower, located at one end of the 28 ft. bay, is of sufficient height to allow of riveting penstocks, flumes, etc. up to 35 feet in length without turning over. The bull riveter has a gap 10 feet deep and is of the Hanna pneumatic type of 70 tons capacity.

The plate working equipment in this shop includes 10 ft. bending rolls (belt driven); Newton horizontal punch with deep throat; heavy double end punch and shear by Smith Bros. & Co., Glasgow, Scotland; 12 ft. flanging cramp, reamers, drill presses, etc., etc. Jib cranes are provided for the heavier machines. The 100-watt tungsten lamps which provide artificial light are suspended from the roof in the 27 ft. bay, while in the other they are carried by brackets attached to the wall below the crane runway.

Before leaving the works all boilers are given a hydrostatic test, after which they are kept in steam at the blowing-off pressure for several hours.

Central Heating Plant.

As previously stated, all the buildings are heated by direct radiation on the Webster system. This is accomplished from the central heating plant shown on the plan. Steam at 50 lbs. pressure is raised in a Marsh & Henthorn return tubular boiler 60 inches in diameter by 14 feet long. A reducing valve on the heating system brings this pressure down to 10 lbs. A Martin $4\frac{1}{2}$-6-7 vacuum pump, controlled by a Dunham regulating valve, delivers the returns to the receiver, whence they are pumped to the boiler by a Martin duplex $3\frac{1}{2}$-$2\frac{1}{4}$-4 feed pump.

General Remarks.

More than fifty different patterns and sizes of hoist are made in this plant; and while the Company make hoisting machinery their leading product, they also manufacture all kinds of tanks, tip wagons, mining skips, stone crushers, vertical and horizontal boilers, locomotive type stationary boilers, with open or with water-bottoms.

The new factory will doubtless enable them to go ahead in the future even more rapidly than they have done in the past.

* * *

YEAR'S RAILWAY BUILDING.

EVERYTHING seems to indicate that the year now closing has been one of remarkable activity and progress in railway construction. Of the Canadian Northern main line between Montreal and Port Arthur no less than sixty per cent. has been completed, and on the lines belonging to the same railway which are being built through the mountains of British Columbia, construction is nearing an end. The Grand Trunk Pacific work, which now is being driven through the mountains to Prince Rupert, has made excellent progress, and the authorities of the railway look forward to the linking up of the system from the Pacific coast to Winnipeg in May or June next. The total mileage completed this year will be very heavy.

This rapid progress is remarkable, not only for its magnitude, but for the fact of its having been accomplished in a period of financial stringency. While business enterprise generally was in a more or less quiescent state, railway construction, which forms a sort of framework for the future development of the country, has been pushed forward at high speed, thus bringing closer the day when new territories will become a producing portion of the country. This activity on the part of the railways has been rendered possible by the vigorous assistance received by them from the different legislatures.

SECTION OF BOILER SHOP.

Plant Extensions, Jenckes Machine Co., Sherbrooke, P.Q.

Staff Article

This well-known firm of general engineers have two extensive plants, one at Sherbrooke, Que., and one at St. Catharines, Ont. The latter is chiefly employed in turning out boilers, while at the headquarters plant at Sherbrooke are manufactured pumps, hoisting engines, air compressors, pulp machinery, rock drills, structural steel, tanks, etc. The Sherbrooke plant has been enlarged by the addition of two new shops.

DURING the year just closing, the Jenckes Machine Co., Ltd., have put into operation two new shops, the construction of which was necessitated by the firm's increasing business. The largest of these is their new air compressor shop completed early in the year. The Company have of late considerably extended their activities in this particular branch of work and are now open to build air compressors of all sizes, centre crank or cross-compound, and for steam or belt drive. They have already got out patterns for sizes up to 1,600 cubic feet capacity and are now designing even larger units.

The new compressor shop stands on a convenient site on the west side of the Company's property, and was designed and built by themselves. It is a fine building of heavy mill construction with steel columns and roof trusses, and is 300 feet long by 110 feet wide. The walls are of concrete up to the window sills, above which level they are of red brick. The floor is of 3-inch tongued and grooved planking spiked to stringers bedded in concrete, the under side of the planks and stringers being coated with tar. The roof is also of 3-inch tongued and grooved planking, this being covered with several thicknesses of asbestos sheets with a good coating of tar between the layers.

The shop is divided longitudinally into three bays, the centre one being 50 feet wide and each of the side bays 30 feet. The main bay is equipped with two electric travelling cranes of 10 tons and 15 tons capacity. These have lattice girders built by the Jenckes Machine Co., the trolleys and electrical equipment having been supplied by Royce, Ltd., Manchester, England. This centre bay is occupied by the heavy motor-driven machine tools and is also used for assembling and testing. In the middle of the shop there is a concrete testing floor and pit. This is fitted with heavy T-slot castings levelled up and bedded in the concrete, enabling compressors to be solidly bolted down during the test. The flywheel runs in a pit which is of ample size for the largest compressors ever likely to be built. The shop is piped for compressed air and compressors being tested pump into the air line, the unloaders in the power house taking care of the excess pressure.

All the machinery in the main bay is motor driven, and is arranged down each side in such a way that every machine can be served by the overhead cranes. The equipment is all high-class, and it is evident that no expense has been spared to ensure a high-grade output. The heavy tools include a very fine Landis grinder for straight and taper work. This machine has a capacity for work of 20 inches diameter by 10 ft. long, and is driven by a 25 h.p. Allis-Chalmers 3-phase, 550 volt, 60-cycle motor. On this grinder, crank pins, Corliss valves, main shafts, etc., are finished. Near this machine there is a 24-inch slab miller by the Canada Machinery Corporation. This is only one of a large number of C. M. C. tools in the shop. Other machines in this bay are a 48-inch Mueller radial drill with change speed gear box, and 48-inch and 72-inch C. M. C. radials driven by variable speed motors. There is also a 36-inch by 16-foot Detrick and Harvey open sided planer.

On the opposite side of the main bay there are a number of boring mills and engine lathes, all of the heavy duty type. The engine lathes are all by the Canada Machinery Corporation and are driven by Reliance variable speed motors of the shifting armature type mounted directly on the head of the lathe. There are four of these lathes, two being 18-inch x 8 ft., one 20-inch by 10 ft., and

NEW COMPRESSOR SHOP LOOKING SOUTH.

one 42-inch by 14 ft. The latter is a heavy forge lathe having tailstock fitted with an independent boring head driven by a separate motor. The main driving motor on the headstock has a small auxiliary motor for shifting the armature when changing speed.

Other equipment of a heavy character includes a C.M.C. 24-inch Dill-type slotter, C.M.C. and Detrick and Harvey horizontal boring mills, 42-inch Bullard vertical turret lathe, 72-inch boring mill by H. Bickford & Co., Lakeport, N.H., 96-inch ditto by the Canada Machinery Corporation, etc.

The lighter machines are all of equally high-class, and are located in the east bay, which is 30 feet in width. They are all belt driven from line shafts running in Chapman double ball bearings, and include, amongst others, a No. 3 Brown & Sharpe plain miller, Landis No. 3 universal grinder, a 4-spindle ball bearing sensitive drill by N. G. Barr & Co., 28-inch Barnes drill press, C.M.C. 24-inch shaper, C.M.C. 24-inch planer, two Jones and Lamson turret lathes, Ford-Smith heavy wet tool grinder, etc. There is plenty of room still available for further equipment, the shop having been specially designed with a view to future requirements.

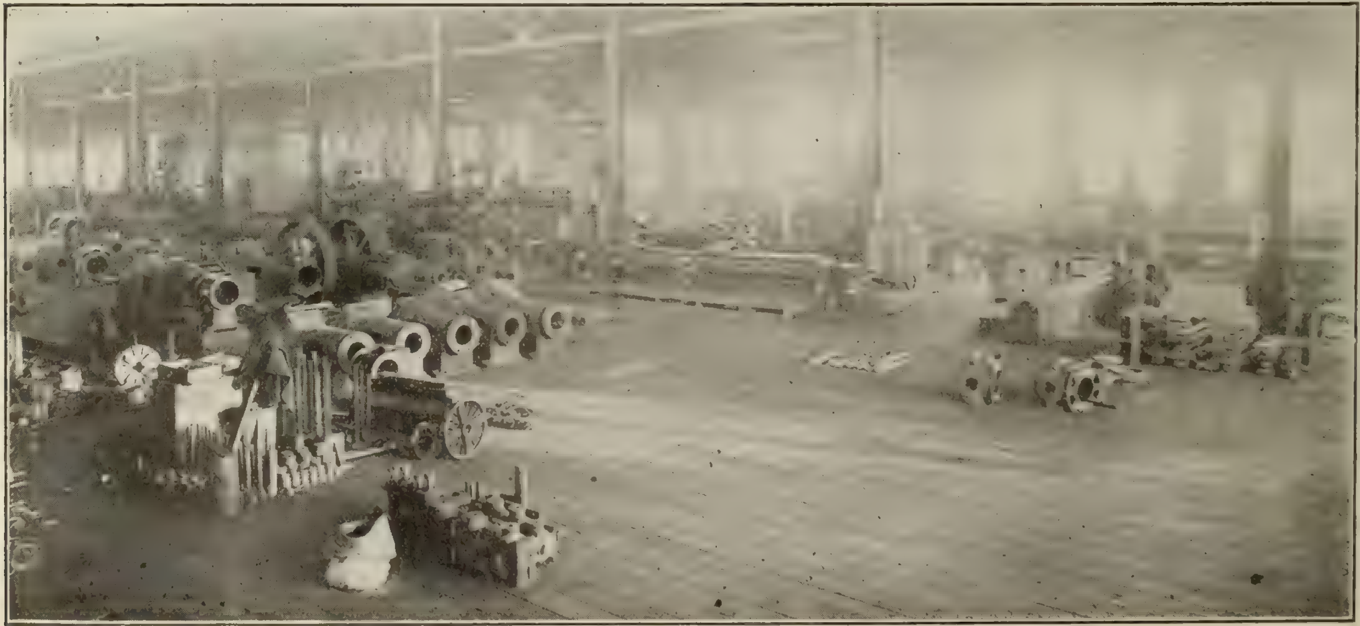
In the middle of the east bay a space is screened off to form a tool room where are located a Brown & Sharpe No. 2 universal miller, Pratt and Whitney tool-room lathe, Washburn drill grinder, etc. A large amount of the work in the shop is jigged; especially the various parts of the firm's well-known line of rock drills. It is, of course, very essential that all spare parts for these shall be absolutely interchangeable to enable repairs to be readily made by unskilled labor. A large business is done in these rock drills and quite a number of men are kept constantly employed on this class of work.

From the east bay there runs out an annex measuring 60 ft. x 40 ft. This is now being fitted out as a blacksmith shop and carbonizing department, and will have thoroughly up-to-date hardening and annealing furnaces. Very careful attention is given to the hardening and heat treatment of the various wearing parts of compressors and rock drills. Outlet valves of the poppet type are made from 3½ per cent. nickel steel and are finished by grinding.

The west bay of the shop is at present chiefly used for storage of castings and for testing rock drills, each drill being thoroughly tried out under 120 lbs. air pressure before being shipped. This side of the shop allows ample space for further machine tool equipment, when the natural growth of the business demands it.

The artificial lighting of the compressor shop is by 100-watt tungsten lamps suspended from the crane runway between the columns, which are spaced at 20 feet centres. Heating is by direct radiation on the vacuum principle, the coils being arranged along the walls below the windows. Further coils are carried by the roof in the side bays, but

NEW COMPRESSOR SHOP, LOOKING NORTH.



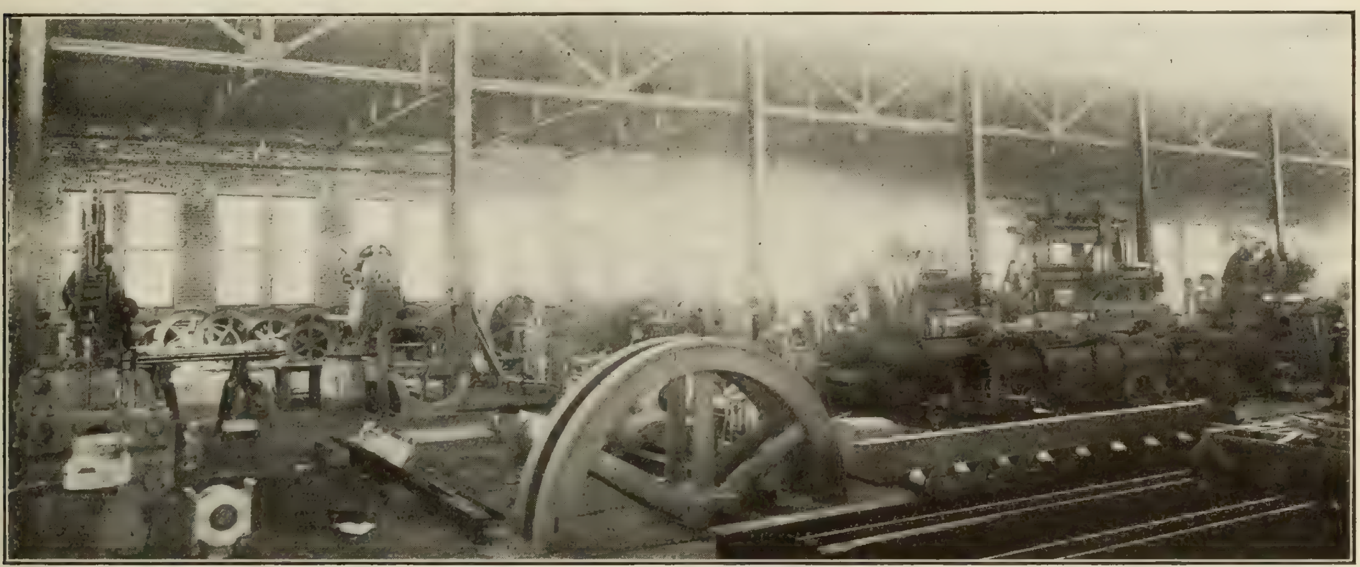
NEW COMPRESSOR SHOP LOOKING TOWARDS EAST BAY.

are not often used, the main coils in the walls being generally sufficient to maintain a comfortable temperature. This installation was put in by the General Fire Extinguisher Co., Providence, R.I.

A standard gauge track runs across the floor near the north end, and, on this, castings, etc., are brought in and finished products shipped out. This new shop has greatly increased the Jenckes Machine Co. output, and is a credit to them in every way. The machine tool equipment is especially fine.

The Structural Shop.

The structural shop is the second addition to the plant made in 1913 and is a steel framed building with concrete curtain walls. The building measures 300 ft. by 60 ft. and is covered by a single span roof. On a runway 22 feet above floor level there are two cranes of 10 tons and 15 tons capacity of similar type and make to those in the compressor shop. Large window areas placed high up in the walls and running the full length of the shop give good lighting in all parts of the shop, arc and tungsten lamps being used after dark. The floor is of tamped cinders and is served by a standard gauge track which enters the shop at its upper end. Large doors in the side walls allow teams to enter when necessary.



NEW COMPRESSOR SHOP TESTING FLOOR.

The work done here consists chiefly of fabricating structural steel, large tank work and heavy plate work; and, as in the compressor shop, the equipment is of a high order. At the lower end of the shop is located the rivetting tower which is equipped with a hydraulic crane and is of sufficient height to allow of rivetting up large pipes or penstocks 30 feet in length. The hydraulic pressure used throughout the shop is 1,500 lbs. per sq. inch and is obtained by an accumulator having a ram 10 inches diameter by 12 feet stroke. This is operated by a Deane 3-in. x 10-in. two-throw motor driven pump. The large bull riveter has a gap of 12 feet and was built by R. D. Wood & Co., Philadelphia. It is of the triple power, outside packed type of 25, 50 and 100 tons capacity. Nearby is a fine 100-ton hydraulic sectional flanging press also by R. D. Wood & Co. This is served by a 9 ft. 6 in. x 6 ft. coal fired furnace.

Other tools to be found here include a heavy double end Cleveland punch and shear with 60-inch throats, two Pells all-steel punch presses of German make, motor-driven horizontal punch, Hanna heavy portable air riveters and the usual equipment of pneumatic tools. The building is heated by the Sturtevant hot blast system, the coils and fan being located above the furnace serving the flanging press.

This shop has already resulted in a largely increased output, and can be readily extended lengthways when the growth of the business renders such step necessary.

* * *

THE GRAY MFG. AND MACHINE COMPANY.

ONE of the more recent additions to the list of manufacturers of machinery in Toronto is the Gray Mfg. and Machine Co., who started operations at their new plant in January, 1913. A site was purchased on St. Clarens Ave., and a machine shop 80 x 40 ft. built for manufacturing foundry equipment such as swing and stand grinders, polishing machines, power and steam pumps, etc. The shop is well equipped for carrying on a general engineering business, and the company realizing that, in order to maintain high class production the best tools are necessary, have one of the most modernly equipped shops, for its size, in the city. The machine tools are capable of the wide range of work necessary in this kind of business, and consist of a No. 4 "Cincinnati" milling machine, a universal tool grinder supplied by the same Company—the Cincinnati Milling Machine Co.; a 4 ft. "American" radial drill and several engine lathes by the Hendey Machine Co. There are also several grinders and a 54 in., 14 ft. low bed "Butler" lathe.

The line shaft is driven by a 15 h.p. Can. Westinghouse motor using hydro power at 220 volts. The shop is lit by "Mazda" lamps, and is heated by steam from a 15 h.p. vertical boiler. Four runways operate across the shop, each being equipped with a 1½ ton "Gray" chain block. There are two jib cranes also fitted with the same chain blocks. At the front of the building are the offices and stores, and at the rear in a separate structure is a blacksmith shop. In the yard is a storage for steel bars, plates, etc.

The company at the present time employ about 20 men and we understand that they are well satisfied with the amount of business done this year. There is sufficient room on the property to double the size of the present plant. The officers are Alex. Gray, president; Robert Gray, vice-president., and James Gray, general manager. Close supervision is given by each member of the firm to all work in progress which ensures high class output.

* * *

The Chapman Ball Bearing Co., Toronto, have opened up agencies in a number of American cities, and are doing a remunerative export business through this instrumentality, despite the 35 per cent. duty.

INDUSTRIAL DEVELOPMENT

GOVERNMENT TO REFINE ORE.

THE Canadian Government has found it necessary to enlarge its refining facilities considerably, and to abandon the proposal to build an extension to the present Mint, for which a sum of $50,000 was voted at last session of Parliament. During the next session a comprehensive proopsal will be laid before the House by Hon. W. T. White.

The policy of the Government is to build such a plant as will be capable of refining as much as possible of Canadian ore. Canada is one of the greatest silver-producing countries in the world, but the ore is refined chiefly in the United States. To build up a home industry is the intention.

Since the mint was opened for business in 1908, silver coinage to the value of $5,710,944 has been produced, composed as follows: Fifty-cent pieces, $751,285; twenty-five cent, $2,586,190; ten-cent, $1,393,582; five-cent, $979,880. In addition to these, a quarter of a million dollars worth of one-cent bronze pieces were minted, $1,500,000 worth of gold sovereigns for the British Government, and Canadian gold pieces to the value of nearly two million dollars.

❖

B. F. STURTEVANT CO. OF CANADA, LIMITED.

ONE of the largest manufacturers from across the border locating in Canada this year is the B. F. Sturtevant Co., of Boston, Mass., who have been incorporated as the B. F. Sturtevant Co., of Canada, Ltd., and have established a new plant at Galt, Ont. The company are at present only manufacturing heating and ventilating systems for the Canadian market, but the products will eventually be identical to those being manufactured at the Boston plant. The company have secured an option on ten acres and are occupying temporarily a brick building, 175x60 ft. It is highly probable that important developments will materialize in the spring and a start be made on a large plant to take care of the increasing demand for the company's products in this market.

The building is well equipped for making steel plate fans, heaters and blowers, and arrangements are being made to manufacture vacuum cleaners. Machinery suitable for this class of work has been installed and includes lathes, gate shears, drills, grinders and pipe threading machines. A 50 H.P. motor drives the line shaft and a steam-driven air compressor supplies compressed air for various purposes. In the rear of the main building is a blacksmiths' shop and a general storage, while at the front are the offices.

The plant at Galt is under the management of Mr. B. M. Chittick, who reports that business has been very satisfactory and that prospects for the future look bright. A head sales office has been opened in Montreal and branch offices will be established in the more important cities in due course.

❖

HYDRO-ELECTRIC RATES.

THE undernoted reductions in Hydro-Electric rates per horse per year went into effect on November 1 for the different municipalities named in the Province of Ontario:—

Hamilton	$16.00	to	$15.00
Dundas	16.00	to	15.00
Caledonia	29.10	to	24.00
London	24.00	to	23.00
Guelph	22.00	to	21.00
Preston	21.50	to	21.00
Galt	22.00	to	21.50
Waterloo	23.50	to	22.50
Berlin	22.50	to	21.50
Baden	37.00	to	32.00
St. Thomas	29.00	to	28.00
Port Credit	31.00	to	28.00

❖

ONTARIO PAPER CO. MILL, THOROLD, ONT.

AMONG the numerous new mills in course of construction along the route of the new Welland Canal, that of the Ontario Paper Co. is one of the largest, and, at the same time, the most interesting, from an electrical standpoint. The electrical power is supplied to the mill from the Ontario Power Co. power house at a pressure of 12,000 volts through two overhead aluminum lines, together with two auxiliary copper lines. The transmission lines enter the mill through a switching station. The lightning arresters are of the General Electric electrolytic type. The switching station contains step-down transformers for fire pump service.

From the switching station the current is taken in underground conductors laid in steel conduit to the motor room and connected to the 12,000 volt bus bars through two motor controlled G.E. oil switches. The bus structure is of concrete and brick, and is situated directly under the switchboard gallery; all oil switches are located on the switchboard gallery.

The motor room contains five 2,000 h.p., 12,000 volt, 25 cycle induction motors built by the General Electric Co. of Sweden, running at 246 r.p.m. These motors are direct connected by flexible couplings to the pulp grinders, each line of grinders having four stones and each stone three pockets.

The main switches on the 2,000 h.p. motors are electrically operated from the motor room floor. The starting rheostats are of the iron grid type. When starting up after the motors have reached synchronous speed, the slip rings are short circuited, and the brushes raised by means of a switch on the motor shaft. This switch is arranged so that it is impossible to close the main switch until the short circuiting switch is in the starting position. All stock pumps, etc., are driven by Crocker-Wheeler 600 volt induction motors. The two Jordan machines are driven by two 150 h.p. auto-synchronous Swedish General Electric motors.

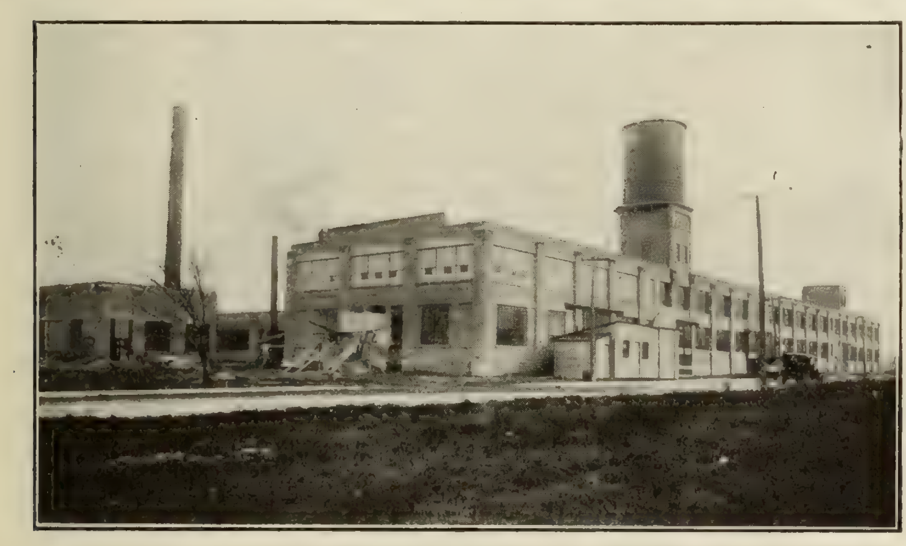
There are at present installed two 204 inch paper machines, said to be the largest in the world, each machine running at the rate of 600 feet per minute, wit ha capacity of 60 tons of paper per day. The paper machines are driven by two Terry steam turbines of 500 h.p. each, running at 1,500 r.p.m.

❖

THE KELSEY WHEEL CO.

THE Kelsey Wheel Co., Ltd., is the latest concern to start operations in the factory district of Windsor, Ont. The property covers an area of 4¼ acres facing MacDougall Avenue and adjoining the Essex Terminal Railway tracks where the company have 1,000 feet of siding, part of which is alongside the shipping platform. The buildings are of modern mill construction and were designed and erected by Wells & Gray, contractors, Toronto. The windows throughout the plant are fitted with "Kahn" steel sash and ribbed glass, all the buildings having exceptionally bright interiors. All heating is by steam, coils being arranged around the walls. The heating system was designed and installed by the Pittlekow Engineering Co., Detroit, while the electric light system was installed by the company. The plumbing contract was carried out by Pennington & Bryan, Windsor, who also installed the lavatories and sanitary drinking fountains provided in each shop. All the buildings are equipped with an automatic sprinkler system which was installed by the Automatic Sprinkler Co., of America, Detroit, Mich. In connection with this system, there is a 40,000 gallon tank on the roof.

The main building is 360 x 60 ft., two storeys high, while provision has been made for the addition of two more storeys when required. It lies parallel to the road on the west side of the plant, and is devoted almost entirely to finishing and trimming automobile bodies. On the ground floor, at the north end, are the offices, the curled hair storage being at the south end. The rest of the floor is used for preliminary painting the car bodies. On the floor above are the trimming and final painting departments. In the former, the bodies are upholstered, two-hand power "Tutting" back presses being used for the purpose. Power machines will be installed later. The final painting is done in an air tight, dust-proof room. The bodies are then put in a drying room from which all light is excluded, the temperature kept moderately high. There are two drying rooms specially fitted for this purpose. In this building are two 3-ton electric freight elevators which were supplied by the Roelofson Elevator Co., Galt. They are equipped with solenoid brakes, safety devices and slack cable mechanism. The car bodies pass through 24 operations before being completed.



PLANT OF THE KELSEY WHEEL CO., WINDSOR, ONT.

Wheel Shop.

The wheels are manufactured in a building on the east side of the plant and parallel to the main building. The wheel shop is a brick building, 300x50 ft., one storey high, with provision made for the addition of two more floors when necessary. At the north-east side are two dry kilns for drying the spokes. The kilns are 40x20 ft. and are heated by steam through the medium of pipes which are laid around the walls and under the floor. The north end of the shop is devoted to the wood-working process, that is, finishing the spokes. The south end is equipped with special tools for finishing the hubs and rims. The machinery for this department was made by the company at their Detroit plant. The wood-working machinery is specially adapted for the work and was supplied by the Defiance Machine Works, Defiance, O. In manufacturing, the parts are worked towards the centre of the shop from their respective departments, where they are assembled and taken to the shipping room adjoining the shop and on the railway siding.

The line shafting is motor-driven and equipped with roller bearings supplied by the Hyatt Roller Bearing Co., Harrison, N.J. The pulleys were supplied by the American Pulley Co., Philadelphia.

Power House.

The power house is located at the northern end of the plant and is 50x50 ft. The building is divided into two sections comprising the boiler and engine room respectively. In the boiler room is a 250 h.p. Goldie & McCulloch water tube sectional boiler with 2,500 sq. ft. of heating surface and a working steam pressure of 150 pounds. It is fitted with hand fired grates having 50 sq. ft. of grate surface. A steel stack 90 ft. high was also supplied by Goldie & McCulloch.

The engine room contains a 200 h.p. Hamilton Corliss engine which was supplied by the Hooven, Owens & Rentschler Co., Hamilton, Ohio. The engine cylinder is 16-in. diameter by 30-in. stroke and is direct connected to a Canadian Westinghouse revolving field alternator.

The company is associated with the Kelsey Wheel Co., Detroit, and the officers are John Kelsey, president; W. H. Ducharme, vice-president; M. G. Campbell, secretary and general manager and B. T. Fox, treasurer.

* * *

THE CANADIAN WINKLEY CO.

THREE years ago the Canadian Winkley Co. located at Windsor, Ont. Later a factory was built, and in December, 1911, operations were commenced. The building, 100 ft. square and of concrete construction, is equipped for the manufacture of a complete line of oiling devices, such as plain and ratchet compression grease cups, oil hole covers, oil cups, brass dowels, etc. This Company is a branch of the Winkley Co., Detroit, Mich., and manufactures the same lines. They do a large business with automobile manufacturers, in addition to that with other industries.

A large part of the building is devoted to the machine shop, but there are also an assembling room, shipping and store room, tool room, nickel plating and dipping departments, and offices. The machinery installed consists mainly of punches and presses, lathes and automatic machines. The grease cups are made from either steel or brass sheets. Blanks are punched from the stock, then put in a press which makes them the desired shape. They are next threaded in a Warner & Swasey turret lathe, following which the hole is punched in a press. The caps are pressed to shape from blanks, and then threaded and knurled. The brass dowel pins are made in a Hartford automatic screw machine, and the oil hole covers in an automatic machine, which will perform ten operations. Four bars can be fed at one time. This machine was supplied by the National-Acme Mfg. Co., Cleveland, O. The line shaft is driven direct from a 40 h.p. "St. Mary's" gas engine using natural gas, and the shop is heated by steam from a boiler fired with natural gas, the latter being also used for lighting the shop.

This Company is one of several who have located in the Windsor district in recent years, and we understand that the management are well satisfied with the results obtained, and with the outlook for future business. About fifty men are employed at present, which is sufficient to take care of a large output.

DODGE MFG. CO., TORONTO, GET LARGE ORDER.

THE Dodge Mfg. Co., Toronto, have received an order for over 300 tons of machinery for the Saskatoon elevator being built by the Dominion Grain Commissioners. The Dodge Co. are the only concern in Canada who have equipped themselves with the necessary plant and machinery for the execution of this class of contract, and, as a consequence, they are kept busy on large jobs for the many terminal elevators which have been recently constructed by the railways and the Government. They have just completed a large job for the Canadian Pacific Railway Co. of St. John, N.B.

TATE ELECTRICS, LTD.

WALKERVILLE, Ont., is the centre of the automobile industry of Canada, and the number of firms engaged in this business has been increased by the Tate Electrics, Ltd., who started manufacturing at their new plant on July 1st, 1913. The Company purchased five acres and built a two-storey brick building, 320 x 60 ft., for the manufacture of electric pleasure and commercial cars. The former include roadsters and coupees to carry from two to five passengers, while the commercial cars range from 500 pound to 5 tons capacity. The Company make their own storage batteries and motor equipment, and have installed the latest machinery for car making. The ground floor is devoted to manufacturing and assembling the cars, and on the first floor the car bodies are made. About 100 men are employed and 7 cars are turned out each week.

NORTH-WESTERN BRASS CO., LTD.

AMONG the most up-to-date brass foundries erected this year is that of the North-Western Brass Co., Ltd., located near the roundhouses, East Calgary, Alta., operations in which commenced during November. This is one of a chain of brass foundries to be erected by this Company which was recently incorporated at Ottawa.

The Calgary foundry, measuring 200 feet by 100, with a garage for the Company's trucks, 40 feet by 70 at the south end, is constructed throughout of reinforced concrete, the only wood in the building being the hardwood finishing in the office, which is situated in the north-east corner of the structure.

Starting at the south end of the building, the foundry is planned on what might be called the progressive system. First comes the metal room, with its 23 metal bins, each of 40,000 lbs. capacity; next the foundry proper, 80 feet by 100, on the left side of which are the battery of twenty furnaces, where the melting is done by means of coke, which comes in on the twenty-car track running along the west side of the building. By this track also are placed the sand storehouses. Sand comes from St. Paul, Minn.

With the same purpose of economy and efficiency, the pattern room, core ovens, the machine tools, the assembly and shipping departments are planned.

Provision for the comfort of the employees is made by a large wash room, lavatories and steel lockers below the offices of the foundry. Good working conditions are still furthered by the exceptionally large proportion of wall space in all departments, which is taken up by the large steel-sashed windows.

The foundry and equipment in running order means an investment of $250,000. Fifty men are being employed to begin with, to be increased to one hundred as business demands. The Company, whose headquarters are in New York, have foundries at Winnipeg and St. Thomas. A. G. Meaden is the manager of the Calgary branch, with H. W. Tritt in charge of the office.

CANADIAN DETROIT LUBRICATOR CO., LTD.

THE Canadian Detroit Lubricator Co., Ltd., have been located in Canada over three years. The plant at Walkerville, Ont., has, however, only been in operation about twelve months. The Company purchased an acre of land on the Walker Road, and built a concrete and brick building, 175 x 50 ft., for the manufacture of "Detroit" lubricators, hydrostatic lubricators, forced feed oilers, packless valves, carburettors, etc. At one end of the building is the brass foundry, 50 x 50 ft., where are six furnaces for melting brass, also a number of moulding machines and core ovens. In another part of the building is the brass finishing department, in which several brass finishing tools are installed. At one end of this are the offices and store room. The machines are driven from a line shaft, which in turn is driven by a motor, current for power and lighting being obtained from the Walkerville Light and Power Co. The Company is associated with the Detroit Lubricator Co., Detroit.

CANADIAN DETROIT LUBRICATOR CO.

CANADIAN-DETROIT LUBRICATOR CO. PLANT AT WALKERVILLE, ONT.

TORONTO STRUCTURAL STEEL CO.

THE coming year will see in operation the new plant of The Toronto Structural Steel Co. The town of Weston, within a few miles of Toronto, is an ideal location for this large and growing industry. Because of its high elevation, congenial surroundings, and its prospects for rapid mercantile and industrial development, it also offers exceptional advantages to the large number of men who will be employed in this plant, and this was one of the considerations which entered into the selection of this site.

The company own a tract of land on the northern side of the town, consisting of twenty acres adjacent to the Canadian Pacific and Grand Trunk Railways. On this property they have erected a shop, 442 feet long, by 130 feet wide. The building is of steel construction throughout, and of the depressed bay type. Continuous steel sash on all sides gives adequate light. The outer walls are of brick and cement plaster, making a very permanent and pleasing effect. The building is floored with "Tar-Roc;" the templet shop having laid thereon a maple floor. The whole interior is painted white. The structure has been designed in such a way as to permit of its being duplicated on the western side, or of giving a total floor space of 442 x 260 ft., the main floor 442 x 160 ft. being broken only by four columns.

Equipment Features.

The stock and receiving yard is located at the north end and at right angles to the building. It is served by a 10-ton, 70-ft. Northern Engineering Co. crane, the runway for which is 405 feet long. The railway siding owned by the company is extended parallel to and of the full length of the shop into the stock yard. The whole lay-out permits of economical handling and storing of raw materials. In the stock yard and close to the main building are located a "Bertram" bending and straightening machine, and a Ryerson friction saw, the latter being equipped with power feed rolls for handling material.

DUNLOP

DUNLOP HIGH SPEED BELTS

Ideal for the purpose intended. Light or heavy duck. No stretching. Maximum adhesion.

DUNLOP CONVEYOR BELTS

Vertical Suspension of Conveyor Belting, as in the case of Mines and Quarries, calls for emphasis on strength and uniform quality. We use a tightly woven duck and a rubber friction of great holding power which permanently unites the different plies. That's why Dunlop Belting doesn't deteriorate.

DUNLOP MAIN DRIVE BELTS

Stand up under any tests — no matter how irregular and severe. No separation of plies. No rotting of duck from dampness; no abnormal stretching.

DUNLOP PNEUMATIC TOOL HOSE

Plain or Corrugated Cover. Wire-wound if desired. Impervious to oils; light and flexible. Easily handled.

"HERCULES" Braided Corrugated withstands 500 lbs. Pressure

DUNLOP GASOLINE HOSE

Specially made to withstand chemical action of gasoline. Lasts much longer than metal tubing and gives motorists greater satisfaction.

Wire-Wound, Round, Half-Round or Flat.

DUNLOP STEAM HOSE

Compounded to resist the action of steam under varying temperatures. Plies of fabric are impregnated with highest quality of steam-resisting rubber and the whole compressed into an inseparable unit.

DUNLOP "SUNSET" HIGH PRESSURE PACKING

Remains soft on the hottest joint. That flexibility gives it the necessary "life" to withstand the highest pressures. A perfect packing for all joints and immune to the effects of steam, alkalies, ammonia.

The Dunlop line consists of Tires for Automobile, Motor Truck, Bicycle, Motorcycle and Carriage; Rubber Belting, Packing, Heels, Hose, Mats, Tiling and General Rubber Specialties.

DUNLOP TIRE & RUBBER GOODS
COMPANY LIMITED

Head Office and Factories :
TORONTO CANADA

Branches :
VICTORIA VANCOUVER EDMONTON CALGARY SASKATOON
REGINA WINNIPEG LONDON
HAMILTON TORONTO OTTAWA
MONTREAL ST. JOHN, N.B.

In the north end of the shop a large space is provided for the laying out skids. Here are to be found a convenient arrangement of beam punch, two 24-inch high speed punches and double-angle shear on a revolving bed, a 60-inch plate shear, also on a revolving bed and a multiple punch, the latter being equipped with a Conley spacing table. All of the above machines are of Bertram, Dundas, make. A "Weiner" revolving coping machine is also installed. A large rotary planer is located at the south end of the shop, while a special portable reaming machine travels on a standard gauge track the full length of the fitting-up section. All machines are individual alternating current motor-driven. In addition to the foregoing, there are five Hanna pneumatic riveters.

The shop is served inside by nine, 2 and 5-ton electric cranes, traveling on the lower chords of the roof trusses. These are of 20 and 32 feet spans. Two narrow gauge tracks, one on each side, run the full length of the shop, and two 10-ton Wilson scales intersect these tracks at the south or shipping end, and have their beams located in the shipping office.

The templet shop, lavatories, locker rooms, power house, boiler house, machine and forge shops are located in the lean-to on the east side of the building, which forms part thereof. These shops are divided from the main building by 14-inch brick walls. The templet shop is equipped with band-saw, pony planer, and boring machines.

Every consideration for the convenience and comfort of the employees has been given. The sanitary arrangements are of the most modern and approved type. Sanitary drinking fountains are placed at convenient points throughout the shop, while adequate wash basins with hot and cold water are provided. Individual lockers will also be available.

Power Plant.

In the power house, an 82-K.W. motor generator set, of The Lancashire Dynamo Co. make, generates direct current for the crane motors. A two-stage Bury air compressor with arrangements for belt and steam drive is also located here. A 130-H.P. Canadian General Electric Co. motor will drive this machine in summer, while a Babcock & Wilcox 200-H.P. boiler will provide for steam drive in winter, as well as supplying the Canadian Buffalo Forge Co. fan system, with which the building will be heated.

The machine shop, with its lathe, shaper, radial drill, bolt-cutting and threading machines, will take care of all repair work, and any additional special equipment that may be required. The forge shop is equipped with a motor-driven Fairbanks power hammer, and with its heating furnaces and forges will take care of a wide range of work necessary in every structural shop.

The shipping yard, located at the south end of the main building, has a 15-ton, 80-ft span Northern Engineering Co. crane, the runway of which is 250 feet long. This yard is also served with a railway siding, which is extended into the main shops.

The combined plants of the company will have an annual capacity of about 22,000 tons, and with the large and complete stock of steel being carried at both the Toronto and Weston plants, prompt shipments are assured.

* * *

THE BROWN, BOGGS CO., LTD., HAMILTON, ONT.

WITH the growth of Canada the demand for tinsmiths' tools and machinery and for sheet metal working machinery has grown commensurately, and the Brown, Boggs Co., Ltd., of Hamilton, Ont., being pioneers in this class of work, have found the demand for their machinery to be so great that they have been compelled to build a new plant. Hamilton, too, is in the Niagara fruit growing district, and of late canning factories have been growing up like mushrooms in Ontario. The Brown, Boggs Co. have been supplying the canning and evaporating machinery required for this industry, and not only do they cater to the trade in Canada, but they do considerable export business. The demand for tinsmiths' machinery comes from South America, and various lines are exported to Chili, British Guiana, Brazil, South Africa, Holland, England, China, New Zealand, and Australia.

The Company was originally organized for the manufacture of tinsmiths' tools and machinery, and consisted of J. M. Brown, N. G. Boggs, W. E. Blandford, and James Anderson. Gradually the firm extended into other lines, and eventually bought out the late S. J. Moore, manufacturers of tinsmiths' and sheet metal working machinery, who were situated at the corner of King William Street and Victoria Avenue, Hamilton. This plant, although added to year by year, until now it covers half a block, recently became inadequate for the firm's growing needs, and, being unable to extend further in that section of the city, a site of eight acres was purchased on the west side of Sherman Avenue, north of the G. T. R. tracks, served also by the C. P. R. and the T., H. and B. Railway. The Company was very fortunate in securing this site, it being one of the most valuable locations in the big factory district which has grown up in Hamilton.

On this ground the Brown, Boggs Co. are erecting a modern plant, designed so as to permit further extensions to cover the whole site when business warrants it. The work is in the hands of Prack & Perrine, architects and engineers, Hamilton and Toronto, who have had charge of many of the largest engineering jobs of this kind in Canada. The plant will consist of machine shop, foundry, pattern shop, pattern storage, blacksmith shop, power house, offices and warehouse. Up to the present only the foundry, the pattern shop and the pattern storage have been completed.

FOUNDRY INTERIOR, THE BROWN BOGGS CO., HAMILTON.

Pattern Shop and Pattern Storage.

The two last departments are housed one three-storey building, with a reinforced concrete frame filled in with brick curtain walls, and with steel sash. The ground and second floors are used for pattern storage, and the third floor for a patternmaking department. An

industrial track connects the building with the foundry, so that large patterns may be easily transferred. The three floors are also connected by an electric elevator. The building is protected by means of a sprinkler system and stand pipe with hose attachment, and has been designed so that should a sprinkler head blow off on one floor the water will be allowed to leave that floor through gulches, without flooding the floors beneath.

Practically the whole of the first two floors are equipped with wire shelves for holding small patterns, though much space is allowed on the ground floor to accommodate the larger patterns. The machinery in the patternmaking shop is run from line shafting, and consists of a 36-inch bandsaw, made by the Preston Woodworking Co., Preston, Ont.; a No. 6E trimmer, by the Fox Machine Co., Grand Rapids, Mich.; a planer and a lathe. There is also a pattern lettering machine. Power is supplied by a Canadian Westinghouse motor. The room is liberally supplied with benches for both wood and metal patternmakers.

The third floor is heated by two downdraft stoves, supplied by the Fuel Economizer Co., Hamilton, seven of which have been installed in the foundry. These stoves are remarkable for the small amount of fuel they consume. Sanitary drinking fountains have been installed on the three floors, and will be used all over the plant. On the third floor there is also a washroom and lavatory for the men.

The Foundry.

Every effort is being made to run the foundry on modern lines. It is in charge of T. A. Brown, vice-president and superintendent. The work consists of small and heavy moulding, considerable work being done for outside firms who demand a superior grade of castings. The construction is of steel, concrete and brick, steel sash and heavy factory glass, so designed as to require as little artificial light as possible. The roof is of asphalt and gravel.

The middle high bay is used exclusively for heavy castings. It is 35 feet wide, and is served by a 16-ton electric crane, made by John T. Hepburn, Toronto. The low bay is 25 feet wide, and is used for light work. A hand crane will serve the whole length of this bay. The other side of the foundry, which is 20 feet wide, is occupied by the core and cupola rooms. The industrial track from the pattern storage runs the whole length of the foundry between the high and low bays. At the west end is a door leading to the yard, where flasks are stored, and at the eastern entrance is a turntable connecting with another track running north to the machine shop and assembling rooms. This track also connects with the cleaning department, which is situated at the eastern end of the low bay.

Cupola Building.

The cupola building has three floors, connection with which is made by stairs or an electric elevator supplied by the Otis-Fensom Co., Hamilton. At present only one cupola has been installed, although room has been left for another of smaller capacity. The cupola has a capacity of 90 tons an hour when going full, and is the product of Sheldon's, Limited, Galt.

The industrial track connects the supply house with the elevator. Fuel and iron is weighed on a set of Gurney scales before being carried up to the charging floor. The latter is constructed of cast iron over reinforced concrete. It is proposed to build a track here, so that cars may be run direct from the elevator to the cupola. Byram & Co., Detroit, supplied the cars, and the Canadian Westinghouse Co. the motor for driving the elevator.

On the floor beneath the blower supplying the blast is installed, also an Ingersoll-Rand air compressor, providing air at 100 lbs. pressure to the moulding machines, air hammers, and sand sifters. The blower is a No. 5, supplied by the P. H. & F. M. Root Co., Connersville, Ind. On the ground floor are situated the washrooms and lavatories.

The Core Room.

Adjacent to this building is the core room. There are two core ovens—a large and a small one. The latter is fired by coke from a pit in the cupola room. It measures about 12 x 7 x 7, and is provided with a track for taking big work. The walls carry shelves for holding small cores. The other core oven is a small portable one, coke fired, which, when opened, does not allow the heat to escape. It has four compartments. This was supplied by the Wadsworth Core Machine and Equipment Co., Akron, O., and the large one by Frederick B. Stevens, Detroit and Windsor. The former Company also supplied a small coremaking machine. Another will shortly be installed for tapering the ends of large cylindrical cores. Near the coremaking department is the superintendent's office.

Cleaning Department.

The cleaning department on the opposite side of the building has been equipped with two tumblers for cleaning small castings, connected with a dust arrester, which is situated outside the building, the dust being drawn from the tumblers by means of a blower supplied by the Buffalo Forge Co., Montreal. Motive power is secured from a 10 h.p. Canadian Westinghouse motor. There is also a grinder in this department, supplied by the Ford-Smith Machine Co., Hamilton. The tumblers were installed by the General Supply Co., Toronto. Other equipment consists of Ingersoll-Rand chipping hammers.

For medium-sized work, the Brown, Boggs Co. use moulding machines, supplied by the Berkshire Mfg. Co., Cleveland, O. It is their intention to instal several more, and they are also considering the purchase of some sand rammers for floor work. Castings can be made on the main floor up to 15 tons.

Artificial light is supplied by the Hydro-Electric Commission. Seven Nulite lamps, 60 to 250 c.p., are suspended on each side of the high bay, while smaller lamps provide light for the low bay and the cupola and core rooms. The time clock was supplied by the International Time Recording Co.

Machine Shop.

A start on the other buildings has not yet been made. The machine shop will consist of two sections, a high bay for heavy work, and the rest divided into storeys. The first storey will be used for medium work, the second for light work, and the third for storage. The two top floors will be direct connected with the warehouse by a bridge, so that a truck may be run across. The high bay will be used principally for assembling, and will be served by a powerful electric crane, allowing 25 feet clear between the crane and the machine shop floor. Electrically operated jib cranes will be used in the low bay. Industrial tracks will connect the machine shop with the foundry and all other departments. The machine shop will be laid out to allow of the continuous progress of the parts.

The boiler house will provide heat for the buildings, and power may be generated if found necessary. Two boilers will be installed at present, with provision for a third.

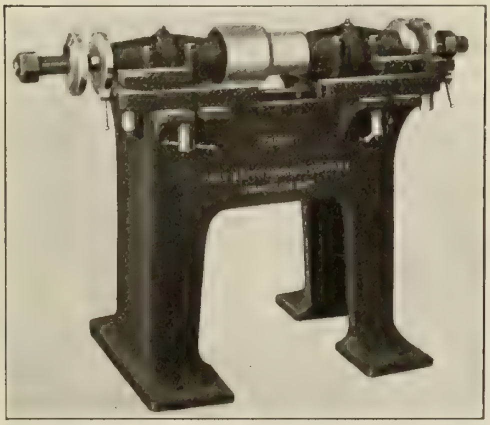
Blacksmith Shop.

The blacksmith shop will be a one-storey building of steel, brick and concrete construction, containing forges, drop hammers, and other equipment necessary for light and medium forge work. The warehouse will be a four-storey building, direct connected with the machine shop by bridges, and will be used for storage and assembling smaller work. It will be of reinforced concrete throughout, with steel sash, and equipped with an elevator. The office will be a four-storey building, with basement, of reinforced concrete, brick, and steel sash. Accommodation

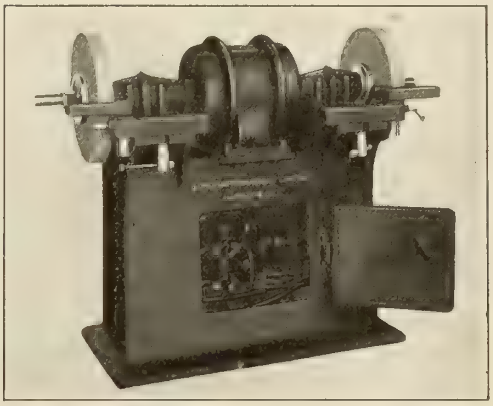
(Continued on page 180).

Quality Grinders

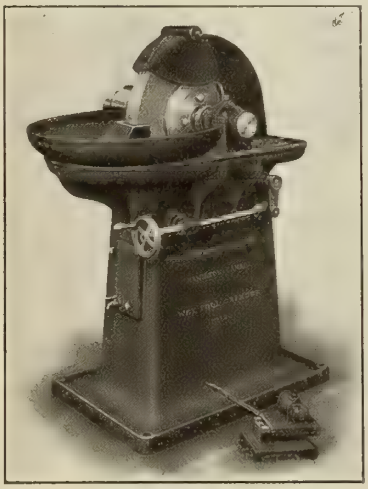
Standard and Special Grinding Machines, Belt or Motor Drive, Swing Grinders, Safety Flanges, Guards, etc.



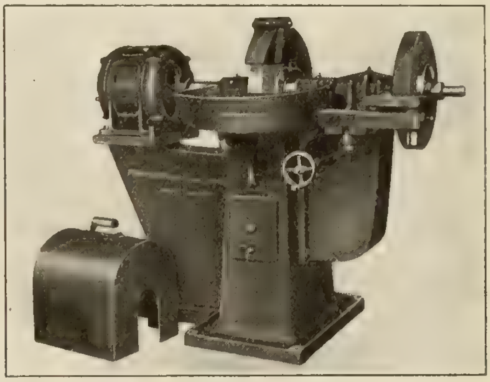
Heavy Grinders



We manufacture a full line of higher grade grinding and polishing machines for all purposes, Belt or Motor Drive, for wheels from 6 to 30 in. diam. They are of convenient design, heavily and proportionately built and the workmanship and finishing are unusually high. Ford-Smith Grinder Equipment is becoming standard where quality service counts.



Stock Deliveries



It will joy you to get our prices on anything in our line from a 10-lb. Bench Grinder to 2,500 fully equipped, self-contained Motor Drive Machine.

Good Overalls are essential to the comfort of the Engineer or Machinist (just as good oil is essential to easy running machinery) and besides they effect a saving of money.

Carhartt's Overalls

give freedom and comfort because of their roomy proportions and self adjusting suspenders.

And they give service because they are made of the best materials, sewed with the best thread, and reinforced where they receive the greatest strain.

The safety watch pocket keeps the watch from coming in contact with dirt, and thereby keeps it in perfect condition.

We make everything in **Overalls, Corduroy Pants, and Gloves**—all of one quality—the best that highest grade material, brains and experience can produce.

It will be to your interest to insist on getting "CARHARTT" goods. If your dealer can't supply you, write us.

FIRST IN THE HEART OF LOYAL UNION MEN.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, December 22, 1913.—While the close of the year finds the machinery and metal-working trades undeniably quiet, a growing feeling of confidence is showing itself, and it seems to be generally believed that the pendulum has about reached the end of its swing and that better times are soon due. One reassuring sign that money is becoming easier is to be found in the fact that from all over the Dominion reports state that collections are considerably better than they were a month ago, this being particularly true of the West—as was only to be expected. It is also an exceedingly encouraging sign that industrial statements issued lately by such firms as the Dominion Bridge Company and the Canadian Car & Foundry Company show earnings well above the average. The local machinery brokers have also had a good year, all reporting a considerably increased turnover as compared with 1912; and this in spite of the dullness of the past two or three months.

Manufacturers, and merchants generally, experienced a great sense of relief on December 18 when the Canadian Pacific and Grand Trunk Railways officially announced that they would continue the present cartage arrangements until further notice, in view of the urgent demands of the merchants throughout the country and their voluntary offer to pay the cost of the service.

Under the present arrangement the railway companies have contracts with the cartage companies, and levy a flat rate for the whole city on the merchants receiving the freight; and it has long been contended that the rate is too low. The railway companies have not yet indicated what the new arrangeemnt will be, whether a higher flat rate will be levied, or whether a zone system will be introduced; but the point of greatest interest to the shippers is that the railways will deal direct with the carters, thus saving shippers and consignees the necessity of making their own cartage arrangements.

This solution of the difficulty was quite unexpected; as up to the day previous to its publication, the railways had protested that nothing would induce them to continue the present scheme after January 1, 1914.

Pig Iron, Etc.

There is very little business doing in pig iron and many foundries are closing down over the holiday season. Copper and spelter are also very quiet. In sympathy with the London market, tin fell heavily during the week and is now being quoted locally at 39 cents, which is the lowest figure since 1911.

Toronto, Ont., Dec. 23, 1913. — The most important feature of the iron and steel market this week was the drop in price of wrought iron pipe. This reduction is noticeable most in small sizes of buttweld pipe and will be appreciated most by plumbers and steamfitters who have already made big contracts based on the old wrought iron prices. The drop applies to all makes of wrought pipe, and is a result of American competition. The change went into effect December 15.

The contract for the city intake pipe has been awarded to the Thor Iron Works, Bathurst St. This was awarded by the general contractors, Roger Miller & Sons, and consists in making the pipe, preparing the bed, and putting the pipe in place from the pure reservoir on Toronto Island to the south tunnel shaft. The pipe will be made according to the city's specifications. It will be 3,600 ft. long, and 84 inches diameter. Carnegie steel will be used, supplied through Drummond, McCall & Co. This job will keep the Thor Iron Works busy for the winter.

C.P.R. Contracts.

The Canadian Pacific Railway has ordered 100,000 tons of rails from the Algoma Steel Corporation and 25,000 tons from the Dominion Steel Corporation.

The Steel Co. of Canada held its second annual convention of sales managers and travelers in Montreal last week, winding up with a dinner at the Montreal Club, at which the toasts were The King, The General Manager, Our Works, and Our Representatives. Several important speeches were made, dealing with the work and policies of the company. Among those present from Ontario, were: Messrs. Robert Hobson, F. H. Whitton, Corbett Whitten, R. G. Wells, Geo. A. Simpson, Geo. Spence, C. E. Harrison, W. D. Muir, J. B. Detwiler, F. B. Cowan, T. Moore, W. A. Rowland, J. H. Webber, T. F. Hodgson, W. F. Hodgson, Geo. Miller, C. G. Knott, J. Orr Callaghan, J. Morrow, J. B. H. Richaby, L. T. Walls, H. G. Rogers and G. D. Hatfield.

All manufacturers outside of structural steel, are specifying more freely against contracts. Practically all manufacturers, particularly implement men, feel that prices of steel are as low as they will go, and are getting ready to talk business.

Most steel concerns are taking stock, or are preparing for it.

Machine Tools.

The Canadian Fairbanks-Morse Co., Ltd., are closing a nice year. They are in the middle of an inventory, and from present appearances, all records of the Toronto house have been beaten. The fiscal year ends with the close of December.

In the machine tool world, every broker is straining to secure a portion of the Michigan Central Railway's order for tools for their new St. Thomas shops, which are practically completed.

The Ford Motor Co., Walkerville, were ordering tools last week, consisting of presses, grinders, centering machines and threading machines, for their motor department. The Kelsey Wheel Co., Walkerville, are buying small machine tools, but the bulk of their equipment was secured in Detroit. Their order for electric motors went to the Canadian General Electric Co.

The Hill Leonard Construction Co., contractors for one section of the new Welland Canal have bought machine tools, locomotives, steam shovels, dredges, etc., from the A. R. Williams Co. this week. The City of Toronto, through Commissioner Harris, is buying machine

There Are No Big Fires

Long Distance Phones Adelaide 902, 903.

tools. The Galt Knife Co., have bought machine tools consisting of grinders, drop hammers, milling machines, lathes, shaper, etc., from the A. R. Williams Co. Their equipment would cost about $5,000.

Machine tool makers are taking advantage of the slack season to improve their machines. Several new types should be put on the market shortly.

Metals.

In Toronto there has been little change in the metal market. One large dealer, after reporting absolute stagnation, remarked that with the pasing of 1913, he trusted good luck would return. 1913 certainly has been a poor year in the metal business.

* * *

St. John, N.B., Dec. 20, 1913.—The closing year in St. John, Halifax, Moncton, Amherst, New Glasgow, and other centres throughout the Maritime Provinces sees manufacturers' and industrial interests well satisfied with what 1913 has held for them. It has been a poorer year generally in many respects throughout Canada, but the East has seemingly not felt the direct influence of the depressed conditions so much as has been the case elsewhere, because talking to any head of an industrial concern, one will be told that his business was particularly encouraging this year. That such is the case reflects considerably upon the prosperity of the East, and has caused keen satisfaction throughout the maritime business world.

New industries have come to almost every town and city; old ones have been enlarged. All are recording now the close of a successful year and entering upon 1914 with renewed vigor and hopes that when it has rolled by they will be even better satisfied than now. It is true that in some spheres of industrial life, notably the lumber industry, trade has been below the average, but this condition is not general, and is not so much the effect of business in the eastern parts of Canada as in the outside world, the British and American markets.

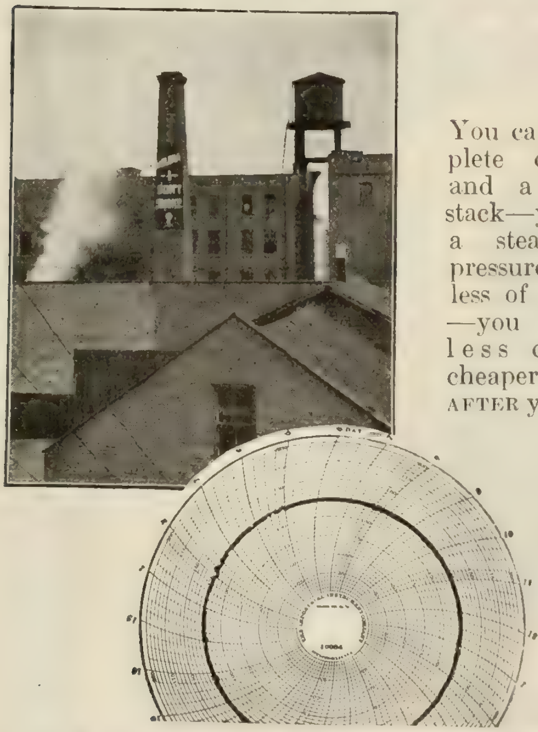
Supplementary letters patent have been issued, increasing the capital stock of the T. S. Simms Co., Ltd., from $199,000 to $298,000. Business with this industrial house since they started in their handsome new factory at Fairville this year has been most encouraging. They are possessed of the most up-to-date brush manufacturing house in Canada, and their stock has found its way as far west as British Columbia, and as far south as the West Indies. Their former factory in St. John, has been taken over by the Corona Mfg. Co. confectionery manufacturers, who are associated to a certain extent with the firm of Ganong Bros., manufacturers of St. Stephen, N.B. The Corona Mfg. Co. are now operating the plant.

Plans have been filed for the I.C.R. spur line from the main line to Courtenay Bay, St. John, and several properties will have to be taken over by the Government before the line can be constructed, but arrangements to this end are about complete. The cost of acquiring will be in the vicinity of $200,000.

There is a possibility of another industry being established in St. John early in the new year. Charles L. Sanford, of the Sanford Barrel and Keg. Mfg. Co. was in the city from Upper Canada this week looking over a possible site. He said it was the intention of his concern to establish a factory with a capacity of 5,000 barrels a day in the Maritime Provinces, and St. John was regarded as a favorite site. The Company plans on having a chain of factories through Canada. They manufacture barrels on a new principle, using wide pieces of wood with the ends slit so as to form the curve of the barrel. Machinery will be installed in the projected plant for the making of egg and berry boxes, crates, etc.

The St. John Street Railway Co. has decided to extend its lines as far as Crouchville, and the continuation of the rails will commence at once. The extension is to be completed to Crouchville by August 1, 1914.

You can do it in Your Plant, too



You can get complete combustion and a smokeless stack—you can get a steady steam pressure, regardless of your loads—you can burn less coal, and cheaper coal—AFTER you install a

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Sarnia, Ont.—The Sarnia Bridge Co., Ltd., has increased its capital from $50,000 to $200,000.

Hamilton, Ont.—Rae Brothers, Hamilton, have started the manufacture of a full line of chucks.

Cobourg, Ont.—A new washing machine factory has been started here by Welsh, Roberts, Bishop & Co.

Gananoque, Ont.—The St. Lawrence Steel and Wire Co. have erected a large addition to their factory for storing raw materials.

Fort William, Ont.—The National Tube Co. have finished their plant, and will employ 100 men in the manufacture of small pipe.

Sarnia, Ont. — Brick masons have started work on the Perfection Stove Company plant. The steel framework is all finished.

Mappin & Webb, the noted Sheffield cutlery firm, who have established a house in Montreal, will spend £150,000 on further development.

Kingsville, Ont.—The R. F. Green Co., Ltd., will build a stove foundry here on a site given by the town, and will borrow $6,000. Voting on by-law, January 6.

Grimsby, Ont.—The Canada Specialty Co., who have converted the rink on Victoria Avenue into a factory, are purchasing machinery, and will begin operations shortly.

Waterloo, Ont.—Bechtels, Limited, manufacturers of clay working machinery, have been offered a big loan if they will move their plant to Mount Forest, Ont.

St. Catharines, Ont.—The Russell-Jennings Mfg. Co., who will erect a plant here next year for the manufacture of augers, auger bits, etc. They have their parent plant at Chester, Conn.

Seek Motor Trade.—In view of the fact that Great Britain supplies only 3½ per cent. of the motor vehicle trade with Canada, British makers are considering a scheme for small groups to amalgamate and float a subsidiary Canadian Company, with a Dominion charter.

Fort William, Ont.—An automobile factory is among the probable new industries for Fort William next year. The man behind it has $100,000 capital, and asks the city for a site.

Fort Francis, Ont.—The Canadian Northern Railway intend making several improvements at this point by building a car repair and machine shops, also increasing the capacity of the present round house to three times its size.

Berlin, Ont.—The Canadian Buffalo Forge Co., Ltd., advise that they will not be ready to purchase machine tools for their new plant at Berlin for a month or six weeks. Allan G. McAvity, managing director, Montreal.

London, Ont.—The Ideal Electric Mfg. Co., manufacturers of electric irons and electrical goods, are moving to Wallaceburg to amalgamate with the Wallaceburg Brass Mfg. Co. An addition to the latter's plant will be erected.

Fort William, Ont.—The new plant of the Steel Co. of Canada will not be ready for operation until the spring. It will have a capacity of 150 tons of finished wire per day, with provision for further extensions. The machinery has not yet been purchased.

Walkerton, Ont.—The Walkerton General Casting Foundry, owned and built by Isadore A. Ellinghausen, commenced operations on December 13. The work is mainly jobbing. The plant is driven by electric power. Besides the regular foundry equipment, it contains several machine tools.

Hamilton, Ont.—D. V. Byrnes, president and manager of the Ontario Pipe Line Co., who has just returned from Chicago, whither he went in connection with the financing of the United Gas and Fuel Co., announces that the $1,000,000 bond issue had been disposed of. The company will erect a large by-product coke plant.

Rock & Power Machinery, Ltd., who recently opened up in the Royal Bank Building, Toronto, are carrying the following agencies:—Kennedy Crushing plants, mining and milling plants, cement plants; McKiernan-Terry rock drills, hammer drills, pile hammers and compressors; Erie engines and boilers; Exeter Machinery Co., locomotive cranes, contractors' hoists, coal handling and piling machinery; F. J. A. B. drill steel, James ore concentrator tables, power plants, (hydro-electric, steam and air), water power plants and supplies, Ottumwa hoists.

Sault Ste. Marie, Ont.—F. H. Clergue announces that all money has been secured, and everything is ready to commence operations on the new dry dock here. The contract for constructing the plant has been let to the British Construction Co. of London, England. Work will commence in the spring and $250,000 be spent next year and $2,000,000 in two years.

Kingston, Ont.—The Canadian Locomotive Co. has received orders for ten more locomotives, which, with the extension of the Government contract which was placed less than a month ago, will keep the works busy until May at least. A. W. Wheatly, general manager of the company, announced this week that orders had been received for the following:—One saddle-tank locomotive for the British Columbia Equipment Co., Vancouver; two saddle-tank locomotives for the Confederation Construction Co., Welland Canal; one saddle-tank locomotive for the Union Carbide Co. of Canada, Welland; six Moguls for J. D. McArthur, Hudson Bay Construction Co.

(Continued from page 702.)

will also be made here for the draughting department.

The foundry at the plant on Victoria Avenue has been converted into an extension to the machine shop, and the pattern storage into a warehouse for new machinery. The former has been equipped with new machine tools, including a Cleveland automatic lathe, a boring mill, made by Butler, Halifax, England; key slotters, and other tools necessary to cope with an increased production of the heavier lines of shears and presses. They are now turning out 10-foot presses, weighing 30,000 lbs.

The officers of the Brown, Boggs Co. are: J. M. Brown, president; T. A. Brown, vice-president and superintendent, and W. E. Blandford, secretary-treasurer. Resident agents are employed in Montreal, Toronto, Winnipeg and Vancouver, and stocks are carried at Toronto, Montreal, London, Winnipeg, Calgary and Vancouver.

BRANTFORD, ONTARIO

BRANTFORD, AS A CANADIAN MANUFACTURING CITY, ranks:—
7th as a producer of manufactured products,
3rd as an exporter of its manufactured products.

BRANTFORD'S PRESENT INDUSTRIAL PROMINENCE is due to its big men of the past whose sons and grandsons are keeping their factories growing with the development of the Dominion at large.

BRANTFORD'S SHIPPING FACILITIES ARE:—

RAILWAY SERVICE. Through the **Grand Trunk Pacific** and the **Canadian Pacific** Railways all points in Canada and the United States are reached.

By the **Lake Erie & Northern Railway**, in course of construction, the Pennsylvania coal fields and steel districts will be tapped by means of Lake Ferries between Erie, Pa., and Port Dover.

The other Transcontinental Railway, **the Canadian Northern**, holds charters for two east and west, and one north and south Railways, which must cross at Brantford in the not distant future.

The **Toronto, Hamilton & Buffalo** connects with the Canadian Pacific and Michigan Central and New York Central Railways.

BRANTFORD'S POWER AND LIGHT SUPPLIES ARE:—
(1) Hydro Electric System, owned by City, Niagara Power.
(2) Western Counties Electric Company, controlling 20,000 Horse Power.
(3) Natural Gas in abundance.
(4) Water supply owned by City.

BRANTFORD'S LABOR CONDITIONS ARE:—
(1) The majority of employees **own their own homes.**
(2) The **best of feeling** exists between employers and employees, labor troubles being practically unknown.
(3) Hospitals, churches, schools, parks, play grounds and amusement halls are plentiful.

BRANTFORD SITES FOR FACTORIES, with switching facilities, can be had at reasonable prices.

BRANTFORD'S GEOGRAPHICAL POSITION is 25 miles North of Lake Erie, 68 miles west of Niagara Falls, and 80 miles from Buffalo.

BRANTFORD. Within a radius of 70 miles is over **one-tenth of the population of Canada.**

BRANTFORD'S SURROUNDING DISTRICT is bound to become one mass of factories and market gardens.

BRANTFORD is the **birth place** of the **Telephone.**

"VICTOR"
HACK SAW BLADES
VICTOR SAW WORKS LIMITED, HAMILTON, CANADA
VICTOR HAND FRAME BLADES
REGULAR
FOR CUTTING SOFT STEEL CAST IRON ETC.
1 Doz 8 in. REGULAR No. 1 VICTOR
VICTOR

For hand frames it's the VICTOR Flexible

When you buy a VICTOR Hack Saw you get a Canadian product—Canadian throughout from raw materials to the finished article—built on the fundamental policy of "HIGHEST quality before everything."

No other hack saw is so scientifically designed, so expensively made, so rigidly tested as the VICTOR. It has raised and standardized hack saw efficiency everywhere.

In the VICTOR Flexible you get all the quality of steel and manufacture that the name VICTOR implies, plus a flexible back. Hard along the cutting edge only. The only flexible blade in the world that equals the best all hard blades in every way except breakage. No other hack saw will last longer, do more work, or do it quicker.

Is it any wonder that VICTOR Flexible is the most talked of hack saw blade to-day?

But remember there's a VICTOR for every purpose. Both **all hard** as well as **flexible** for hand frames and **all hard** for power work. This does not mean a confusing number of blades, it simply means a scientific solution of your hack saw troubles. Be sure to select the right blade for the work in hand. If in doubt, write us. We're always glad to help all we can, and it may save you money.

"Get a box and try 'em." Look for the VICTOR sign. It points the way to the solution of your hack saw troubles. Write for name of nearest VICTOR dealer.

M.C.R. ST. THOMAS SHOPS EQUIPMENT.

THE following are a few of the machine tools on which the Michigan Central Railroad Co. have asked prices for their new St. Thomas shops. A committee of mechanical engineers are now considering the prices submitted, and will shortly award contracts. The whole order amounting to about $50,000.

One high power hack saw; working capacity up to 5-in. and 6-in. diameter.

One heavy duty motor-driven planer, 30 in. x 30 in. x 8 ft. bed

One single spindle sensitive drill press, having capacity for drilling ½-inch holes.

One heavy duty 16-inch back geared crank shaper.

One heavy duty, quick change screw cutting engine lathe, with 30-inch swing.

One medium weight engine lathe with capacity to swing 38 inches over carriage.

Two heavy duty, quick change, screw cutting engine lathes, with 16-inch or 17-inch swing, complete with A.C. motor for 550 volts, 3-phase, 25 cycles.

Two heavy duty, quick change, screw cutting engine lathes, with 17-inch or 18-inch swing over shears.

One Tool room lathe, 18-inch swing, about 6 ft. centres.

REMINGTON ARMS—UNION METALLIC CARTRIDGE CO.

ONE of the more recent and important developments this year in the Windsor district has been the new plant which the Remington Arms-Union Metallic Cartridge Co., of Bridgeport, Conn., have under construction.

The company have purchased a site adjacent to the C.P.R. and Essex Terminal Railway, and covering 100 acres outside the city limits, but they will have connection with the city water and sewer services. It is estimated that $100,000 will be spent in buildings and equipment principally for the manufacture of shot gun ammunition.

When completed, the plant will consist of seven single storey brick and steel buildings of saw-tooth roof construction. The roofs will be entirely of asbestos-steel, the new type of construction for roofs and curtain walls evolved by the Asbestos Protected Metal Co., Beaver Falls, Pa. These buildings will be absolutely fireproof throughout and of the most modern design, affording a maximum amount of light which is absolutely necessary in manufacturing the intricate parts which go to make up the products. The plant will be equipped with the most modern automatic machinery, safety devices and fire protective apparatus.

Taking Trouble

investigating the quality of the files you buy, means saving trouble when those files are used in your shops.

And making things as easy as possible for your men—giving them fast-cutting, long-lasting crucible steel.

Delta Files

means saving dollars paying for profit-devouring, non-productive time.

Look at it from any angle, it boils right down to this:— Delta Files are not "cheap" files, but they save their cost many times by the slice they make in the pay roll.

Order from your jobber, or from us direct, but always look for the trademark.

TRADE MARK
DELTA

It safeguards the interests of file users everywhere.

CEDAR RAPIDS.

Exceptionally good progress has been made with the development work at Cedar Rapids, the work being now two or three months ahead of schedule. The steel work of the power house is now being erected, and much of the equipment is now on the spot awaiting erection. This includes four of the generators and four water wheels, with their accessories. The generators have a capacity of 10,000 k.v.a. each, and have been constructed by the General Electric Company. Nine units are being installed at present. Of the first nine water wheels six have been built by the J. P. Morris Co., Philadelphia, and three by Wellman, Seaver & Morgan, Cleveland.

The foundations for the transformer house are completed, and a commencement is about to be made with the superstructure. The total amount of concrete still to be set is 80,000 cubic yards, and there are 1,600,000 cubic yards of earth still to be excavated.

The following table gives the percentages of work already completed up to December 1, 1913:—

Rock excavation	23.2 per cent.
Earth excavation, other than stripping and trench work	60 per cent.
Transporting and placing excavated rock	27.7 per cent.
Stone protection	2.7 per cent.
Transporting and placing excavated earth	62.5 per cent.
Concrete in power house sub-structure placed ...	25.5 per cent.

The power house is being built of reinforced concrete by the Unit Construction Company, St. Louis, Mo., on their special system. Unit construction is a patented method of erecting reinforced concrete buildings. It differs from the ordinary method of construction in that all concrete is cast in forms on the ground in the shape of individual units, which are seasoned and afterwards assembled in place in the building, as provided for in the design. Joints can thus be made at predetermined locations regardless of the daily progress of the work. And if there should be any question as to the quality or strength of a unit an individual test can be made. As the units are allowed to "season" before erection, the concrete has shrunk before the unit becomes a part of the completed structure. In this way shrinkage stresses in the building are reduced to a minimum.

Canadian Business Men who have made their millions

How they did it.

Every Merchant and Business man should read the two stories that appear in the January Number of MacLean's Magazine.

The Lumber Kings of the Saguenay

being the story of the three bachelor brothers, telling how the present William Price, M.P., became a multi-millionaire. This sketch is full of interesting anecdotes and information that should be familiar to every Canadian.

The Rise of McCurdy M.P.

The Millionaire of Nova Scotia

This story shows how this young Napoleon of Finance became the head of a powerful brokerage and achieved political renown. Don't miss reading this sketch.

The other excellent articles are no less interesting to business men. In fact the January Issue is teeming with information and interest, peculiar to the Merchant, Business and Professional men of Canada.

Here are the titles of other articles that will interest you:

Culture in Business Life, by Alexander F. Eastmen, M.P.

A King in Poultrydom. A University Graduate and a School Master whose hobby has made him, by Herbert Gransford.

How it Feels to Carry Money; Money Making Fur Animals, and other features in Fiction and Romance, **Review of Reviews,** etc.

Then you must not forget the Series of Articles by Frederick W. Wile dealing with the men who are making modern Germany the greatest Commercial Nation in the world to-day. The January issue contains an intimate sketch of Von Terpitz—the man who built the German Navy.

Drop us a Post Card, tell us to enter your name on our Subscription List and commence with the January Issue.

Ker & Goodwin
Brantford, Canada

WINDSOR, ONTARIO

the most southern city in Canada and the logical location for branch factories

WHY WINDSOR WINS

1—Because it is located on the Detroit River, which is the international boundary line, opposite the city of Detroit, Mich., and is in close proximity to the home offices in the manufacturing centres of the middle states.

2—Because it is the handiest point on the Canadian map for receiving shipments of raw material and unfinished parts.

3—Because it has five trunk lines of railway, each connected by the Essex Terminal Railway for inter-switching.

4—Because of its unexcelled transportation facilities by rail and water.

5—Because it has two city-owned factory districts, with light, water, sewers, pavements and other improvements.

6—Because it grants liberal concessions in the way of tax exemptions, free water and free light for ten years to manufacturing plants employing 25 hands or more.

7—Because it has natural gas and hydro-electric for light and power.

8—Because it enjoys attractive residential advantages and is the home of trained mechanics.

9—Because it is the natural centre for steel and metal-working plants.

10—Because it is the progressive and rapidly growing city of Ontario.

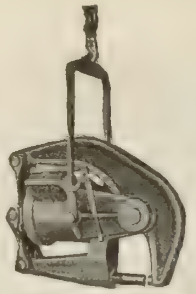
Keep down your Riveting Costs

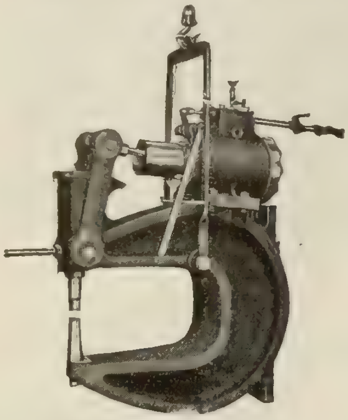
by using

ALLEN

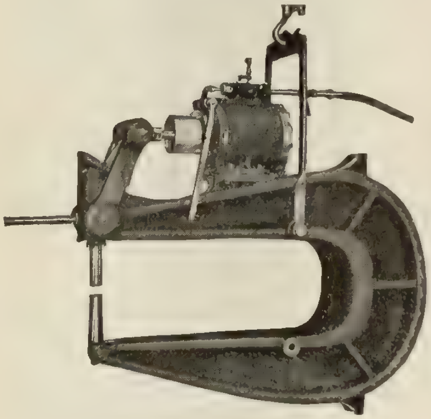
RIVETING MACHINES



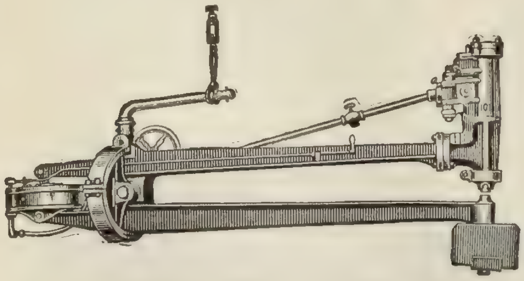
ALLEN Compression Lever Riveter.



ALLEN Jaw Riveter.



ALLEN Jaw Riveter.



The ALLEN Boiler River will
Drive 1¼" Rivets in 6 Seconds.

First in the field, and built for uniform and long service, the "Allen" machines assure the **tightest** and **fastest** riveting at the **lowest** cost.

Allen "Jaw" Riveter

This riveter is most suitable for all descriptions of bridge and building construction work. By a special patented device any desired change in the distance between the dies is easily effected.

Allen "Alligator" Riveter

This riveter is especially adapted for all types of steel car construction riveting work. Suspended on a double axis, machines of this pattern can be arranged in any position, thus making them indispensable for work of this character.

Allen "Compression Lever" Riveter

This riveter is built expressly for heavy bridge, beam and girder work and is widely used for this purpose.

Allen "Stake" Riveter

This riveter is built expressly for close channel column work where flanges are turned in and measures only 3¾ inches at the widest section of stake.

Allen "Boiler" Riveter

This riveter is built expressly for boilers, tanks, stacks, etc., and may be constructed with any desired distance between arms.

"Whatever the Riveting—there's an "Allen" for the Job."

PRACTICAL BOOKS FOR PRACTICAL MEN

These books were written especially for practical self-instruction, by experts whose experience and standing make them authorities.

They are so clear that the beginner can understand them; so thorough that the trained worker can learn from them; so practical that they will give any man a working knowledge of the subjects that they treat, and save him both time and money.

They not only cover the fundamental principles of mechanical science, engineering practice, and business usage, but also present the latest developments and the accepted practice of the most successful men, in those lines.

They give men a practical knowledge of practical things, which enables them to think more accurately and to work more efficiently; and they compose the most helpful, reliable, and comprehensive series of **home study** books ever put upon the market.

THIS IS THE MACHINE

that has found so much favor in shops where small parts are threaded.

THE GEOMETRIC THREADING MACHINE

is not an ordinary bolt cutter. It is a machine for threading duplicate parts correctly and rapidly.
Fitted with one of our Style "D" Die Heads and perfected in every detail.
The Die Head opens and closes automatically. The operator starts the work in—the thread is cut. He releases the work, and placing in the new piece, the Die Head is closed ready for cutting the thread.
Thousands of threaded pieces are turned out each day by one of these machines. The only interruption to continuous threading is for the work to be removed and the new piece placed in.
From 1/8 in. pipe thread to 1 in. diameter is the usual range of the machine, but where fine pitch threads are to be cut on larger diameters, a Die Head can be supplied that will take care of the work.

Submit your threading proposition to us.

THE GEOMETRIC TOOL COMPANY

Chicago Steel Bending Brakes

We are exclusive Manufacturers of Steel Bending Brakes, and our product shows it.

Chicago Brakes are made in longer lengths and for heavier bending. These extremes, we believe, are only possible or practical with our steel construction, where the arrangement is such that the full strength of wide steel plates is utilized. The strain of the operation is delivered against the edges of the plates. This makes for rigidity, reliability and lasting accuracy.

Steel Castings are used for the hinges and all other end parts on which there is a strain insuring against possibility of breakage.

By the process of gearing down, much force is applied with use of minimum of power. Only about three horse power is required to operate full capacity.

Our Catalog, showing our various makes of Bending Brakes and giving full descriptions will be mailed you immediately upon request.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand Rammer in operation.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock: — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

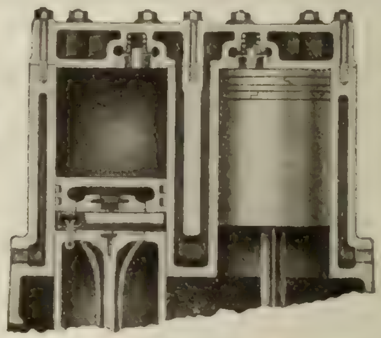
Most Cooling Where Most Needed

Not Only Are Cylinder Walls Water Jacketed, But Cylinder Heads and Valve Chambers Also—In Fact—



X Section Through Discharge Valves.

Curtis Air Compressors

Have About 80% More Water Cooled Area Than Double Acting Types

This is only one of the many features of Curtis Compressor design that make for maximum output. It's a feature you should consider when selecting a compressor, because it insures lower discharge temperature, less loss of power through shrinkage of air in receiver and pipe line, and it also insures a larger amount of air compressed each stroke.

There are other features equally as important that are strictly Curtis features only, for instance, light vanadium steel disc valves (only 1-16 of an inch in thickness, and never require "grinding in"); valve design that makes for minimum clearances. And other features which lack of space prevents our mentioning.

Tell us your air requirements, and we will gladly send you full information and prices.

Write for Bulletin C-1.

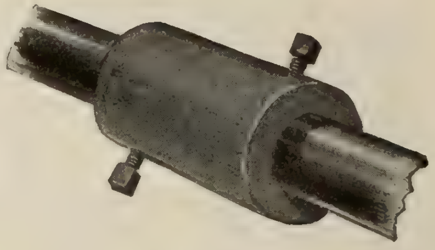
A Projecting Set Screw is a Menace —It Puts Your Life in Danger



If the old-fashioned set screw with projecting head was intended as an agent of destruction, it is surely 100% efficient in its service.

Statistics will tell you about the number of employees killed or maimed by this destructive little screw. And the worst of it all is that the accidents are so unnecessary. When you consider that **Allen Safety Set Screws** entirely eliminate this danger, you'll agree that such accidents are purely the result of negligence.

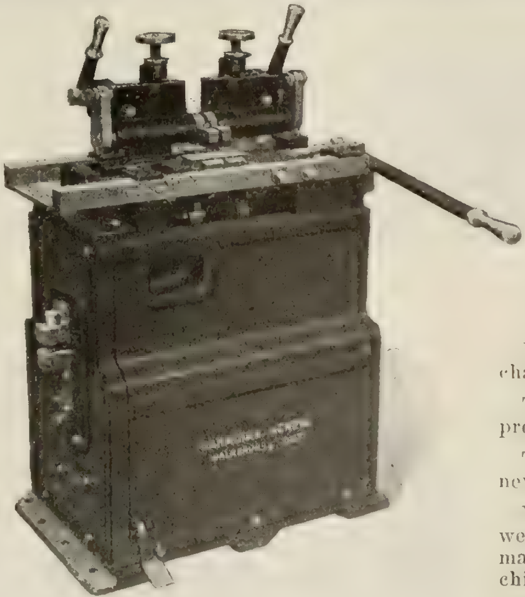
The Modern Idea—Allen Safety Set Screws

Allen Safety Set Screws have no projecting heads and are flush with the surface when screwed into place. They put an end to all troubles of broken heads and drilling or chipping out mushroomed screws. "Allen" Screws are made from high test steel bars, the threads will not stretch and screws will not break no matter what pressure is brought to bear.

We'll gladly send you free samples which you can put to any strength test you want—the test will convince you that while you may have seen screws that looked like Allen screws, you have never seen any with their strength and pressure resisting qualities.

All sizes from ¼ in. to 1 in. carried in stock. Send for circular No. 3 and sample screw.

THE ALLEN MANUFACTURING COMPANY
ST. JOHNS, P. Q., CANADA



Agnew

Spot and Butt Welding MACHINES

You take no chances when you purchase an Agnew Electric Welder.

They are built intelligently for rapid production and long service.

They are always ready to work and never out of order.

We are experts in the art of electric welding and when you get an Agnew machine you get more than a good machine; you will have the benefit of years of experience in the art of welding.

We assist our customers in working out difficult welding propositions.

Ask for catalog and samples; we build twelve different sizes of machines and make prompt deliveries.

ARCTIC METAL

Why We make Arctic Metal

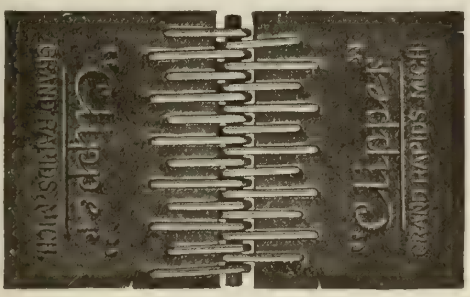
Because the consumers are looking for a babbitt that is always uniform; that will stand up under Heavy Pressure; that will keep cool under High Speed. The consumers have found these conditions in

Arctic Metal

Manufactured by

Tallman Brass & Metal Co.

HAMILTON, ONT.



The "Clipper" Joint

is the most flexible part of the whole belt.

Think about this, you mechanical men.

Do you know of any other belt lacing that is strong and that bends easier than the belt itself? You don't—because all the other lacings are weaker and stiffer instead of more flexible. The

"Clipper" Belt Lacer

TRADE MARK LACES IN THREE MINUTES

makes a joint in 3 minutes that will outlast 3 other joints, and a boy can do the job.

Besides being strong and more flexible than the very belt itself, the

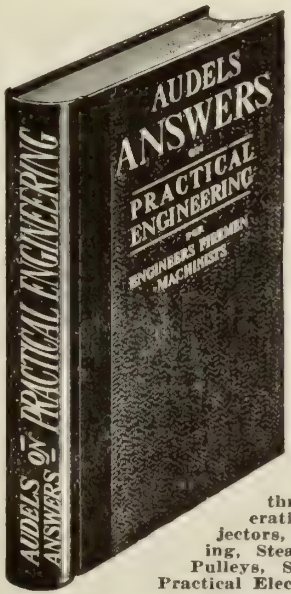
"Clipper" joint hugs the pulley

just as closely as the belt does. Saves power—saves belts—saves lacings—saves time—saves money.

Ask for our book. It's free.

Clipper Belt Lacer Company

998 Front Ave., Grand Rapids, Mich.



ENGINEERS

THIS book deals largely with the foundation principles which govern the practice of steam engineering. Nothing so soon condemns the applicant as want of knowledge of the every day practice and simple laws relating to the care and management of a steam plant.

No one is expected to know everything, but all are required to be familiar with certain facts which may be called "the beginning of things."

The lack of knowledge of the small things carries conviction of the same lack in the larger.

Plain facts, that you should know, are plainly explained in AUDELS ANSWERS ON PRACTICAL ENGINEERING, answers your questions on

Air, Water, Steam, Fuel and Heat, Steam Boilers, Boiler Construction, Water Tube Boilers. The Steam Gauge, The Safety Valve, Properties of Steam, Installation of Boilers, Management of Boilers, Engineers' Law, Firemen's Law, Steam Engines, The Valve and Valve Gear, The Corliss Engine, Engine Arithmetic, Lubricators, Installation and Operation of Engines, Steam Pumps, Injectors, Feed Water Heaters, Steam Heating, Steam Traps, Belts, Gears and Pulleys, Steam Turbines, Refrigation, Practical Electricity, Elevators.

Understand the framework of which your work is but a cross bar. Know something of the cause of which your work is but an effect. Know something of the effect of which your work is the cause. And, above all, know why it is done one way and not another.

LEARN THE THEORY UNDERLYING THE WORK

PRACTICAL ENGINEERING contains 288 pages fully illustrated, handsomely bound and printed, and is in every way a first-class book.

FREE (No Duty)
EXAMINATION

Sign and mail the coupon, and it will bring to your plant a book of sterling merit, for free examination. You can have one week in which to dig out valuable information contained in its 200 or more pages.

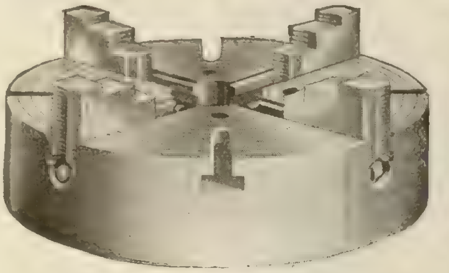
EXPORT

THE ROYAL CHUCK

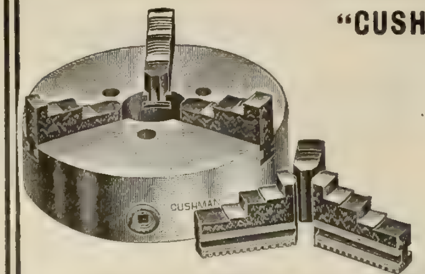


is made of the best material, and the workmanship is first-class. It has an extra heavy body and will stand hard usage. They are accurately milled and the parts well fitted.

We guarantee every one. For sale by all dealer or write

RAE BROTHERS
Manufacturers
HAMILTON CANADA

"CUSHMAN" CHUCKS



are generally known as the "heavy pattern," being designed for hard service.

Their accuracy and reliability have been proven over and over again, and the name "Cushman" on your chuck is a guarantee of satisfaction.

Our line consists of many styles and sizes of Lathe Chucks, Drill Chucks, Centering Chucks and Face-Plate Jaws.

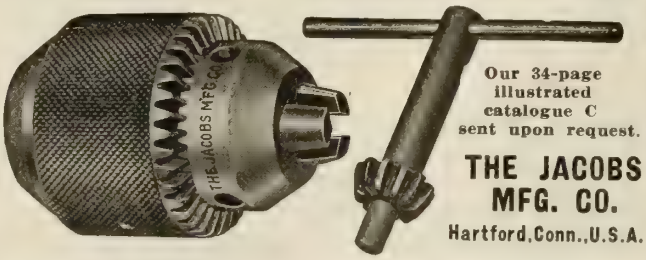
Catalog Free

THE CUSHMAN CHUCK CO.

Hartford, Established 1862 Conn., U.S.A.

Ten Years of Phenomenal Prosperity

Our tenth fiscal year closed October 31, 1913. Our last year has been our most prosperous year. This fact is, we think, convincing evidence of the superiority of our product—the JACOBS IMPROVED DRILL CHUCK. What do you think of it? Use the JACOBS IMPROVED DRILL CHUCK and you will learn why our last year was our most prosperous year.



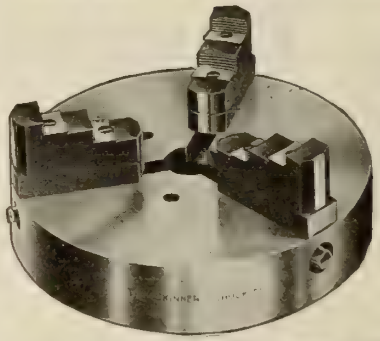
THE JACOBS MFG. CO.

Our 34-page illustrated catalogue C sent upon request.

THE JACOBS MFG. CO.
Hartford, Conn., U.S.A.

SKINNER UNIVERSAL CHUCKS

3 or 4 JAWS



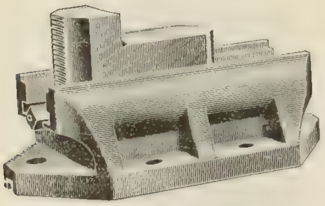
Regularly Equipped with our patent reversible style "J" jaws. Other style jaws furnished when required. Made also in the Combination pattern.

Write for new 1913 catalog illustrating our full line.

YES—WE MAKE STEEL BODY CHUCKS.

THE SKINNER CHUCK CO., Factory and Main Office: **NEW BRITAIN, CONN.**

A Plan for Better Chuck Service



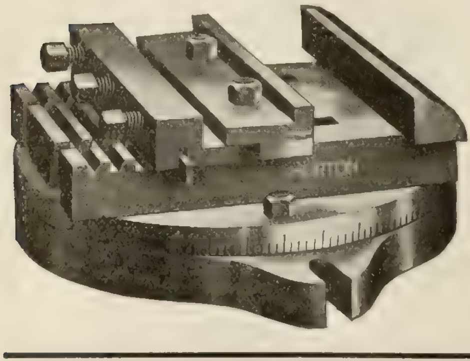
New Pattern S. E. Horton Face Plate Jaws. Steel as well as Iron. Also the heaviest type of STEEL Chucks.

It pays to send your inquiry to a manufacturer who is familiar with all types. You not only get better information and explanations as to comparative features but often we can save initial cost by having a lower priced chuck that will do the work.

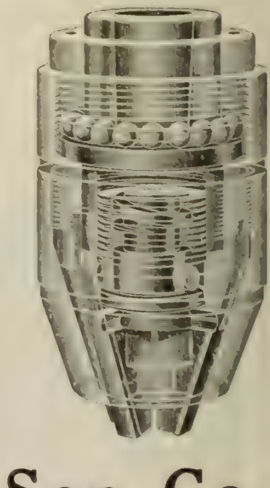
The best of service for users of chucks in the Dominion.

Iron Body Independent Chucks. Steel Body Independent Chucks. Face Plate Jaws (Iron and Steel). Boring Mill Jaws (Iron and Steel). Geared Screw Chucks (Universal and Combination). Universal and Independent Two-Jaw Chucks. Geared Scroll Chucks. Drill Chucks. Planer Chucks.

HORTON Planer Chucks



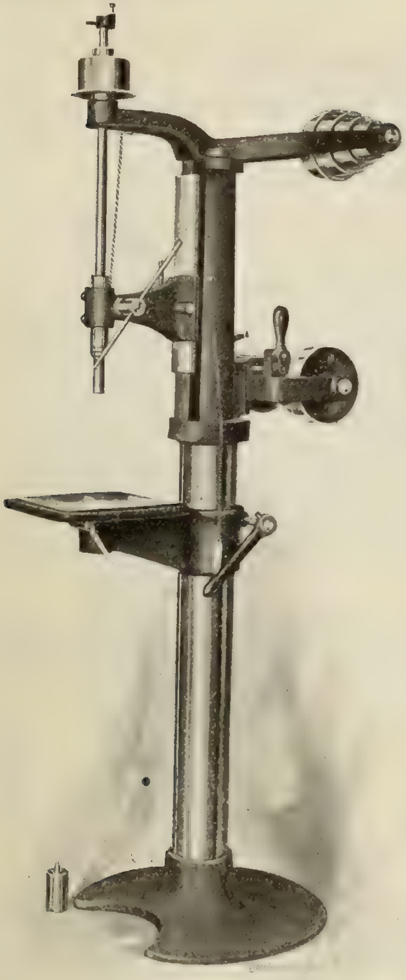
Horton-Morrow Chucks



For high-grade workmanship, high quality material and mechanical accuracy, the "Horton-Morrow" is in a class by itself. With this chuck there is positively no danger of sticking; the jaws are easily released by hand through a differential screw arrangement.

The E. Horton & Son Co.

Windsor Locks, Conn., U. S. A.



Sensitive Drills

Four Styles

Will drill from No. 0—to ½ inch and drill to centre of 14-inch circle.

Beaver Drill Chucks and Quick Changing Collets.

We manufacture other styles of drill presses, also special machines, machine parts, tools, punches, dies, jigs and repair work.

Prices and circulars covering each drill upon application. Inquiries solicited.

SAFETY FIRST

The railroads and many of the industries are strenuously pushing a campaign with the object of making SAFETY the FIRST and foremost thought among their employees.

The object is twofold: First for the protection of the men from a humane standpoint, and second, to prevent the disarrangement of the general routine of work through injury to workmen.

They are making changes in the methods of handling material, knowing only too well the risks taken when a mechanic attempts to adjust a heavy casting or move a piece of work which really requires mechanical aid.

You can totally eliminate this risk by installing

Ingersoll-Rand Air Hoists

to protect your men as well as yourselves.

They are built for accurate and quick adjustment of material or work; also for the safe and rapid transfer of castings, etc.

These Hoists are absolutely reliable in their operation. They combine Safety and Saving—one ton is raised five feet high, twenty-eight times for one cent.

If you feel enough interest in an economical method of handling material and incidentally protecting your employees write for catalog and circulars.

SET
CLEVELAND
DRILLS AND COUNTERSINKS COMBINED
TRADE MARK
THE CLEVELAND TWIST DRILL CO.
New York Cleveland Chicago

Actual Size

For Your Convenience

There's no longer any need of hustling around looking for a Countersink of the right size—no need of wasting time and roughing up one's temper that way, for the

No. 19 Set "CLEVELAND"
Drills and Countersinks Combined

will give you the Tool you want without delay—remove the cover and there it is *ready*.

The illustration shows the Set, actual size. This box will conveniently slip into your pocket—always be handy.

As for the quality of the Combined Drills-and-Counter-sinks—well, they are "CLEVELAND Quality," made of the finest tool steel, specially heat treated.

You will find the No. 19 Set one of the best little time-savers that has ever come your way. You can get full particulars from our circular No. 3-C.

BRONZE BUSHINGS

carried in stock

WERE YOU EVER STUCK for bronze bushings and had to keep your machinery idle until you made a pattern and got delivery of the casting? If you were, you will admit this has cost you money and will **(in these times of labor saving)** appreciate the fact that we have on hand for your convenience, available to you any time, a stock of over **One hundred and fifty** assorted sizes in the rough of **Bronze Castings** well adapted for your machinery repairs, bearings, journals, and all kinds of work into which you have to use **BUSHINGS.**

We issue a special stock list, copy of which we shall be pleased to mail you if interested, showing all dimensions of our various sizes, of which immediate shipment is guaranteed on receipt of order.

Avoid costly delays in your repairs by writing for our stock list.

LYMBURNER LIMITED

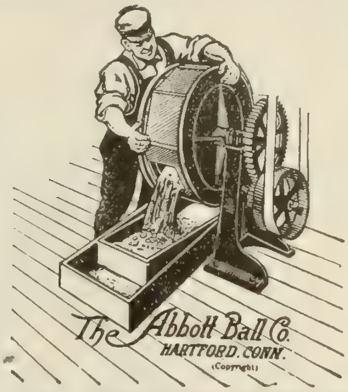
5 to 15 Commissioners Street

MONTREAL

Do You Burnish A Bushel

Of Small Metal Articles with 15 Minutes' Labor?

If not, why not? Why should you pay experts for hours or days of hand-buffing, when you can get the same work done better at a labor cost of only a few cents?



The Abbott Ball Co.
HARTFORD, CONN.
(Copyright)

The Abbott Burnishing Barrel

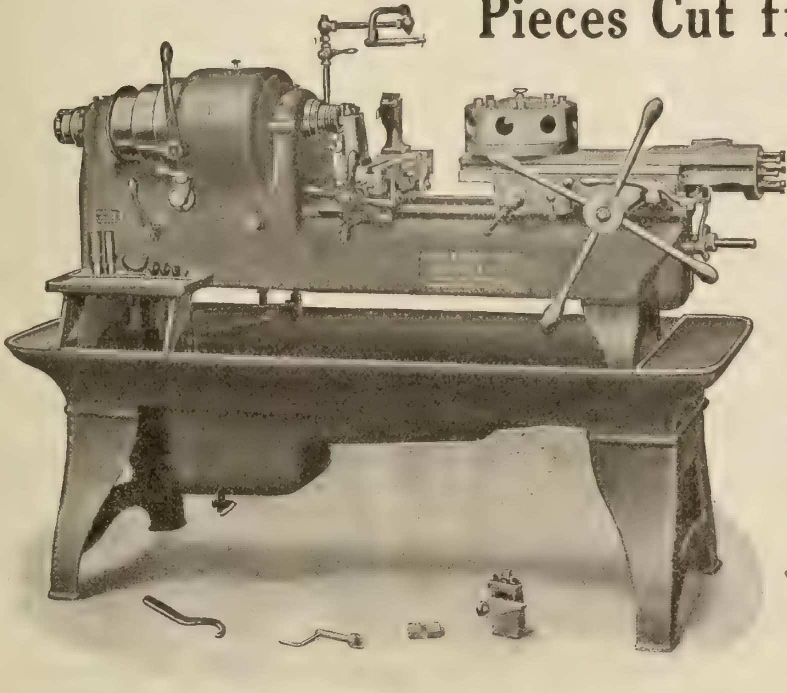
will take from a peck to a bushel of small metal articles at a time, and burnish them perfectly in one to five hours. The operating cost is a couple of cents worth of soap chips, some water, one-half to one horse power to run it, and about five cents worth of time (15 minutes) for one operator to load and unload it. Nor is this economy at the expense of quality, for the finish is smooth, hard, brilliant and uniform—no broken or bent parts—no material removed. It is economy plus efficiency.

Write for free booklet and approval offer
And send along samples for burnishing.

The Abbott Ball Company

1047 Elmwood Avenue Hartford, Conn.

Chucking and Turning of Forgings, Castings, and Large Pieces Cut from the Bar



Can be done accurately and profitably on

B. & S. PLAIN SCREW MACHINES

There is a wide field of usefulness for these machines in every shop manufacturing machine tools, heavy machinery, or automobiles. Plain and irregular pieces can be handled with equal facility, and work can be rapidly produced, owing to the convenient arrangement of all parts which enables the workman to operate the machine quickly.

We build these machines in three sizes.

Send for a copy of our general catalogue, giving specifications of all our screw machines and other machine tools.

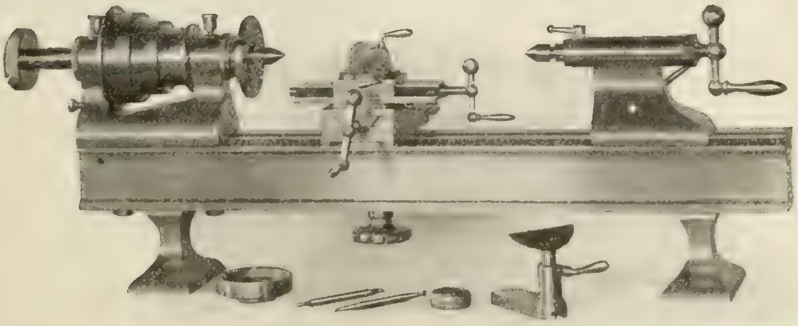
Rivett Bench Lathes



No. 3½ Lathe

Length of bed	32 in.
Distance between centers	18 in.
Swing	7 in.
Spindle Capacity	½ in.

Have you ever used a Rivett Lathe? If not you have a Surprise coming to you!

Accuracy? Highest obtainable!

Strength? Plenty of it and for all-round handiness they cannot be beat.

The Cut shows the smallest Lathe of this type made by us. It is just the machine for those experimental jobs you want to take up first chance you have. You want for such work a Machine on which you can depend for Accuracy.

Drop up as line now!

COTTON WASTE

Made in Canada

Our brands for sale by Hardware and Oil Dealers

Polishing Grades—Cream, White.
White " XXX Extra, Grand, XLCR, Empire, Star
Colored " Fancy, Lion, Standard, RR.

Made by

The Dominion Waste Mfg. Co., Limited

Sole Selling Agents:

Scythes & Company Limited

18-22 Church St., TORONTO
33 Common St., MONTREAL

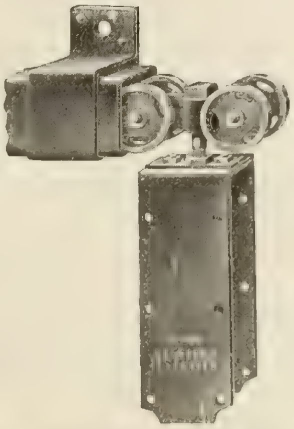
Also headquarters for
Cordage, Twines, Cotton Duck, Tents, Tarpaulins, Flags.

In the Factory After Dark

Manufacturers are daily coming to a fuller understanding as to just what good illumination means. They find it means efficiency, economy and profit. They find that the workman who can see what he is about will do more work and better work, will make fewer mistakes and spoil less material; will not tire so quickly and be more content; less liable to subject himself to injury than the man who is obliged to work under poor light.

The **Humphrey Gas Arc** is giving **complete satisfaction** to customers. We are at your service, whatever your lighting problem.

The Consumers' Gas Co.
12-14 Adelaide St. West. Toronto
Telephone Main 1933



The One Right Hanger For Heavy Doors

RICHARDS-WILCOX TROLLEY HANGERS are recognized by leading Engineers as the SURE WAY to hang sliding doors. Made in many sizes and styles, according to requirements, for House, Garage, shr ments, for House, Garage, Warehouse Doors and Carrying Systems.

We also make Labelled Fire Door Hardware of all kinds. Catalog on request.

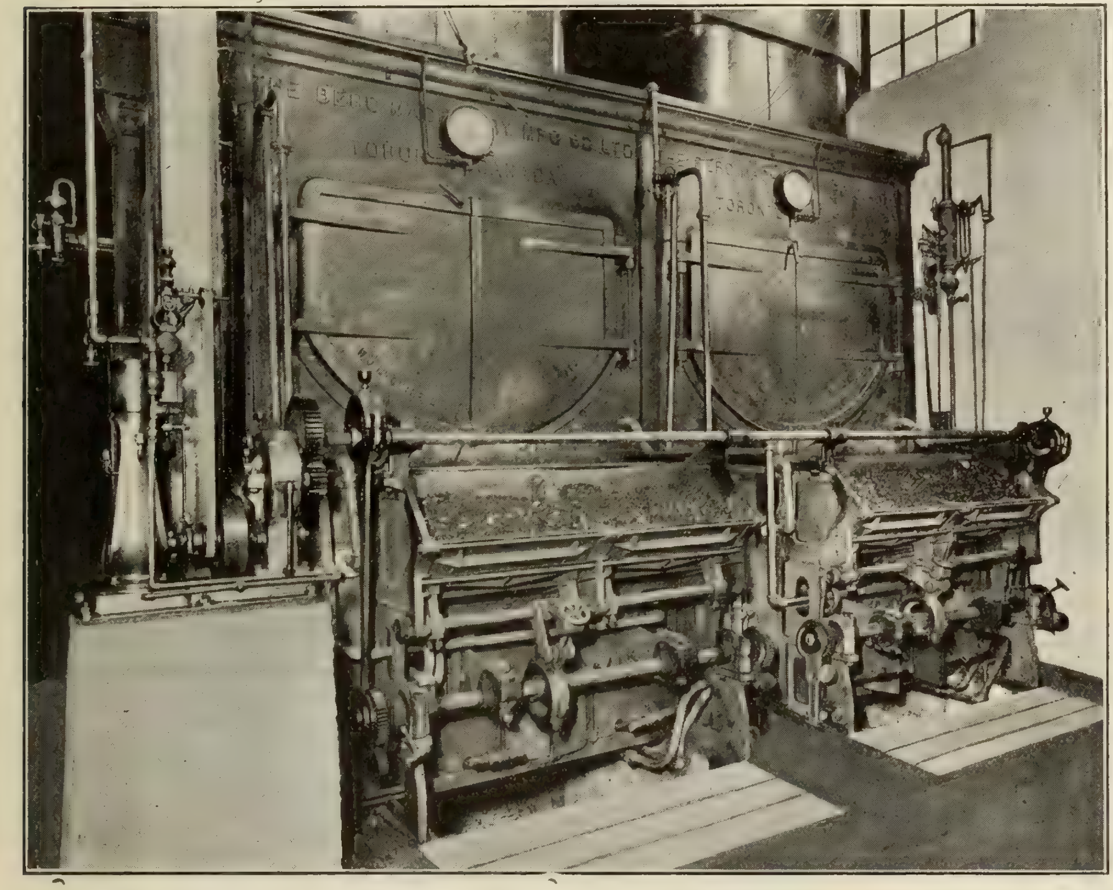
FULTON STOKERS

THE LAST WORD IN STOKER DESIGN

When you buy a Stoker BUY PERFORMANCE not a NAME PLATE. If you don't **insist** on results **before** you buy, don't blame anyone but yourself **afterwards** if you find you are not getting satisfaction. Mechanical Stokers that sift unburned fuel to the ash pit, that cannot carry heavy over-loads, that must have high and expensive chimneys, that throw away good coke in the ash, that cannot be operated independently of one another, or that have a heavy bill of repairs, are as out of date as a single cylinder automobile engine. You buy a motor, 1914 model, why buy a stoker 1888 model?



2 No. 6608, 150 H.P. Fulton Stokers installed under Horizontal Return Tubular Boilers.

THINK THIS OVER.

Perfect Combustion.

1. Absolutely NO sifting of unburned coal through the grate bars to ash pit, and practically NO good coke in the ashes.

Universal in Application.

2. Will burn any grade of Caking or Non-Caking Coal, Anthracite Screenings, Lignite, Peat, Tan Bark or Sawdust.

Repairs Eliminated.

3. All parts in contact with the fire completely water-cooled. All repairs for two years free. Repairs less than one-quarter that of any other stoker.

Smokeless in Operation.

4. Completely smokeless on any kind of fuel.

Completely Automatic.

5. Fires kept in continual agitation preventing formation of large coke lumps. Hence poking, slicing and baring usual on other stokers entirely unnecessary.

6. Even, Positive and Continuous feed over entire grate surface preventing airholes and bare spots in the fire, thus securing high economy over wide ranges of capacity.

Make your Fireman an Intelligent Assistant, Not a Coal Heaver.

We are prepared to guarantee results impossible with the older designs. Why not put it up to us? Write for further information.

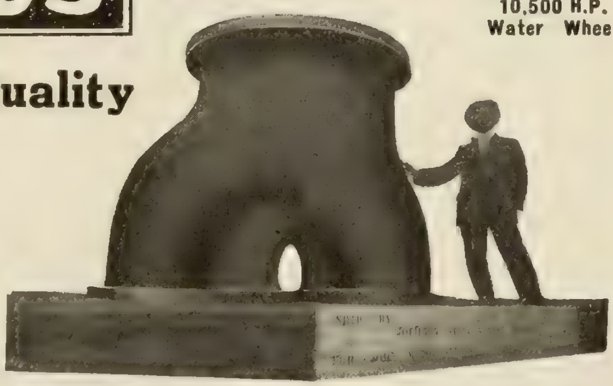
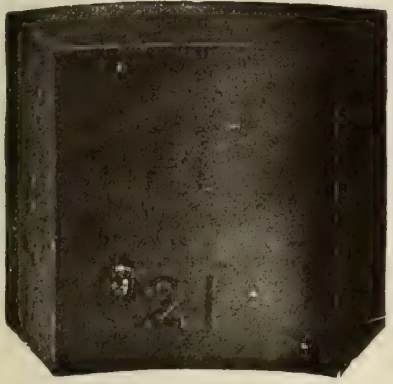
JOLIETTE STEEL CASTING WORKS, Ltd.
Head Office and Foundry: JOLIETTE, P.Q.



Casting for a 10,500 H.P. Water Wheel



Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

An Inside Story Of The Crucible

In the walls of a Dixon Crucible is spun the secret of its efficiency, durability, economy, dependability and its world wide reputation.

If walls had voices, as they are said to have ears, a story of surpassing interest could be told.

—of a concern, the largest, oldest and only one of its kind in the world founded by the inventor of the graphite crucible.

—of a concern with world-wide knowledge of graphite deposits, with use for all forms and grades of graphite and therefore with no incentive to use other than the correct form and grade of graphite in each of its many products.

—of skill in workmanship which only the heritage of 86 years of experiences and discoveries can make possible.

—of a standard which does not permit of anything but absolute uniformity of the highest possible order.

In satisfaction alone it is worth while buying Dixon Crucibles, and in the economy of service Dixon Crucibles are supreme.

Write for booklet No. 223A. "The Care and Use of Crucibles."

SMOOTH-ON
TRADE MARK REG. U. S. PAT. OFF.

SMOOTH-ON
IRON CEMENTS
No. 1, No. 2 and No. 3

Permanently stop all leaks of steam, water, fire or oil, in iron or steel castings, boilers, tanks, piping, pumps, screw thread joints, flanged joints, etc.

Smooth-On No. 4 is unequalled for filling in blowholes in iron or steel castings.

The Smooth-On Cements are easy to apply and make permanent repairs, proved by years in use.

Every engineer should read our new No. 12 illustrated instruction book—FREE. It tells when, where and how to use the different Smooth-On Cements. Send for it now.

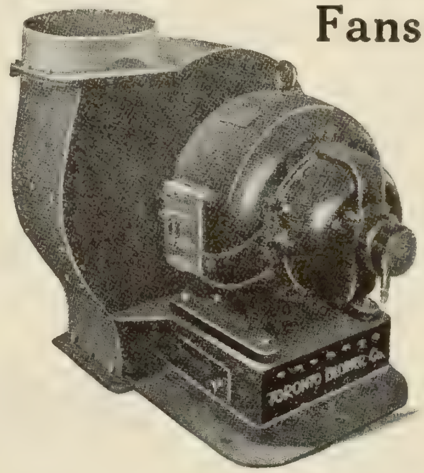
Ottawa, Ont.

CASTINGS

Direct Connected Exhaust Fans



EXHAUST SYSTEMS

for grinding, buffing and polishing—**dust of all kinds.**

Special exhaust systems for brass, gold and silver work.

Cost of these systems **pay for themselves in a short time.**

Systems for one or more wheels operated with little expense.

Old systems remodelled, and equipped with our latest dust-collecting hoods.

Estimates given gratis by our Expert Engineer.

Toronto Blower Co.
156 Duke Street

SLY

Sand Blast Mills

Heavy In Design, Efficient In Operation and Absolutely Fool Proof

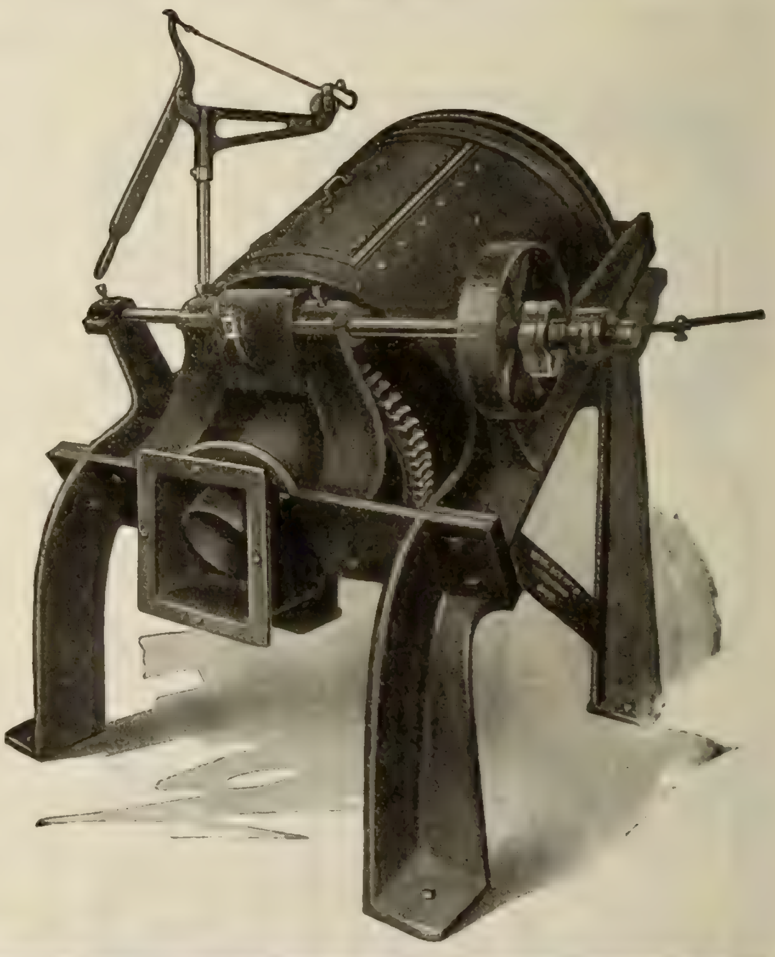
Barrel is 1 inch thick, to insure the greatest possible wear. The front head is stationary and holds the door and nozzles in position.

The front head is supported by four adjustable rollers, having large wearing surfaces, and dust-proof bearings.

There are no obstructions inside the mill to break delicate castings nor can heavy castings break the mill.

Mill is perfectly balanced and requires no more than one or two horse-power to operate.

Loading and unloading of machine is a special feature found in no other Sand Blast Mill.



The No-Wear Nozzle

The form of nozzle possesses a number of **distinct advantages** over any other. As there is practically no wear, its life is indefinitely prolonged.

There is no constant expense for new nozzles; nor the annoyance of replacing them.

The Sly No-Wear Nozzle is of such design as to keep constant the supply of air at all times.

The amount of wear on the air or sand hose is reduced to a minimum, as the sand falls to the **Sly No-Wear Nozzles** by gravity.

Let us give you complete details of "**Sly and Satisfaction.**"

Write for Catalog "C."

Cleveland, O.

Complete Sand Blast Rooms and Equipment a Specialty

MADE IN CANADA

We are the only manufacturers of

Foundry Facings

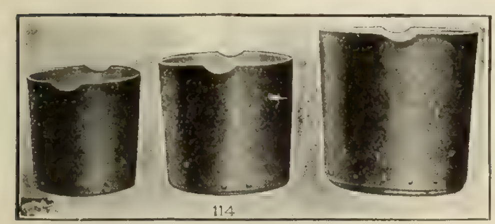
in Canada

MADE IN CANADA

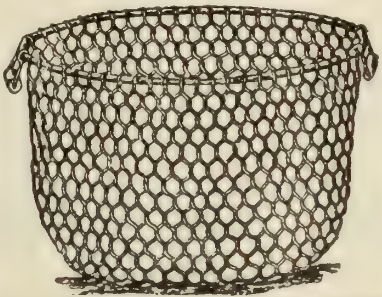
What it means to you

When you buy from us you get facings that are the result of the most careful analyzation of every pound of crude material—a facing that is of the highest prevalent quality. You pay no middleman's profit and no duty.

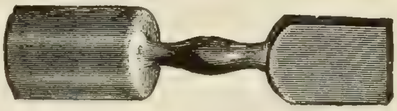
If you can get facings that are subject to duty and selling at the same price as "Hamilton" Facings they are lacking in quality. A quality equal to that of our facings cannot be produced at a lower price and leave the manufacturer a profitable margin.



Foundry Ladles—Flat bottom riveted steel bowls provided with forged lips and vent holes.



Coke or Charcoal Basket—Made of galvanized steel wire.



Bench Rammers—Made from Maple Hardwood well oiled.

Foundry Supplies and Equipment

The quality of our Foundry Supplies and Equipment is sure to meet your complete approval.

We believe we make the best goods that brains, skilled mechanics and good material can produce.

Place a trial order with us now and let the goods speak for themselves—they always make good.

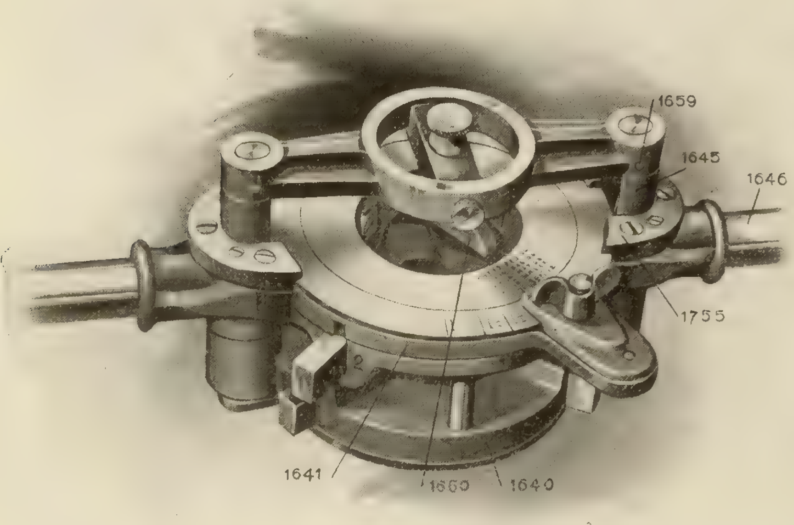
High Grade
Pipe Threading and Cutting Tools



"Premier" Die Stocks

1 to 2 inch right and 1 to 2 inch left, with one set of dies.

No. 1 Premier. ½ to 1¼. One Set Dies. Right or Left.
No. 2—1 to 2 inch. Right and Left. One Set Dies.

Starts itself on the pipe and automatically throws itself out after a "Briggs" Standard Thread is cut instead of backing off, which spoils the dies.

The troublesome leader screws and nuts are eliminated. The new patented off-set Die, which can be used only in the "Premier," has overcome the difficulties. The die is made in such a way that once over the pipe, it accomplishes what any other make would in going over twice, as one set of teeth is lower than the other, consequently every tooth does an equal amount of work.

No separate bushings or dies to carry around and lose. The Premier has but one lock and that is used only when changing from one size to another. The centering device has a scroll cam, without locks, which operates the three jaws that guide the stock on pipe.

VERY EASILY OPERATED

RAPID WORKERS

"Beaver" Die Stocks

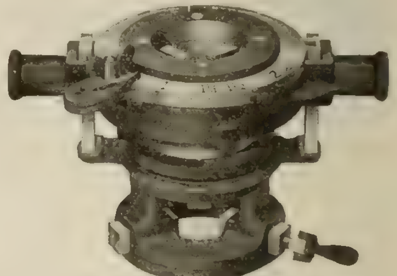
(Adjustable)

The only tool made with a universal chuck. This means your pipe is always straight, and no grip screws or bushings to bother with.

The Beaver cuts a tapered thread with a narrow die similar to a lathe tool by moving or expanding the die while the thread is being cut.

The Die cam is revolved positively by a slotted post which controls the taper.

Each stock contains one set of dies which can be used to cut four different threads—a twist of the wrist sets the size.



Beaverette ¼-¾, one set of Dies.
No. 25 Beaver—1 to 2 inch, right hand only.
No. 41 Beaver—2¼ to 4 inch, right hand only.
No. 60 Beaver—2½ to 6 inch, right hand only.
No. 80 Beaver—4 to 8 inch, right hand only.

"Beaver" Square-End Pipe Cutters

cut pipe off clean and square and leave no burr to ream out or file off.

No. 1—⅛ to 1 in.
No. 2—½ to 2 in.
No. 4—2½ to 4 in.

One set of knives—no changing.

Automatic feeding and as easy to operate as a die stock.
Works easier and quicker than a wheel cutter, and saves the extra team of reaming.

Our circular will give you complete details.

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed, Write us.

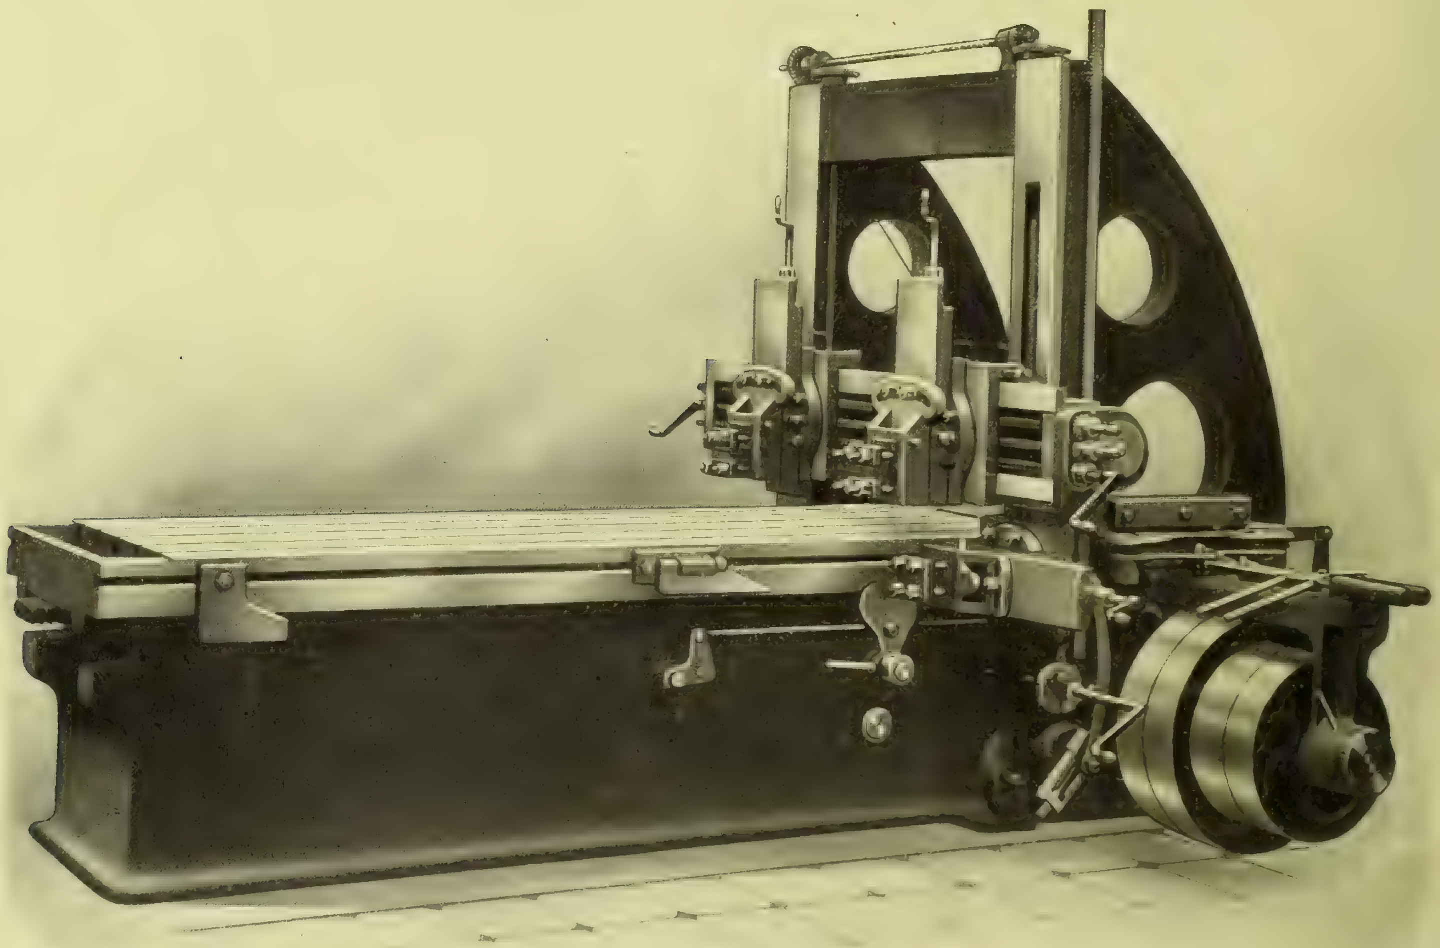
HIGH SPEED PLANING MACHINES

Manufactured by
C. REDMAN & SONS.



36" x 36" x 8'—0" Planer With 2 Heads on Cross Rail and 1 Head on Front Standard.

This cut shows the latest design of High-Speed Metal Planing Machines. All gears and rack operating the table are steel, machine-cut from the solid. All the feed motions for horizontal, vertical, and angular cuts are reversible and variable without stopping the machine. All the gears are placed inside the bed, and the VEES are extra wide on wearing surfaces. The belt-shifting gear is steel throughout.
